It provides an extensive glossary, discusses the future of gas cleaning operations, and the evolution of the industry. This series of eight books is designed to present descriptions of: 1) the development of technologies for a variety of feedstocks, including the viscous feedstocks which are often referred to as heavy feedstocks, utilizing advanced pre-treatment processing and hydrotreating; 2) an analysis of the catalyst deactivation mechanism for developing optimum technologies for processing feedstocks with low reactivity; 3) the development of advanced technologies applicable to the viscous feedstocks; 4) the development of advanced hydrocracking processes for heavy feedstock upgrading; 5) the development of innovative upgrading processes for the viscous feedstocks; and 6) the role of biomass in the future refinery. Furthermore, each book is a stand-alone volume that will bring the reader further up-to-date and adds more data, as well as processing options that may be the processes of the evolving twenty-first century. As the eighth book in the series, this book will focus on the various refinery processes that are used for gas cleaning operations. The target audience includes engineers, scientists, and students who want an update on crude oil processing and the direction of the industry in the next 50 years. Such personnel include: 1) professionals in the refining industry; 2) technicians in the refining industry; 3) industry management personnel who need to understand the various processes and the role of these processes in producing the desired feedstocks for further processing and the use of solvents to produce saleable products; and 4) the academic staff and graduate students who are moving into the refining industry. Any non-technical readers with help from the extensive glossary will also benefit from the series.
