QuestionAnswer 5 What are the most common causes of poisoning in toxicology board exams? The most common causes include drugs of abuse (e.g., opioids, benzodiazepines), household chemicals, pesticides, and heavy metals such as lead and mercury. How is the management of acetaminophen overdose typically approached in toxicology? Management involves early administration of N-acetylcysteine (NAC) to replenish glutathione stores, along with supportive care and monitoring of liver function tests. Activated charcoal may be used if ingestion was recent. Which diagnostic tests are most useful in identifying toxic exposures? Serum drug levels, toxicology screens (urine or blood), specific assays for heavy metals, and imaging studies when appropriate are key diagnostic tools in toxicology. What are the key features of opioid toxicity on clinical presentation? Opioid toxicity typically presents with respiratory depression, miosis (pinpoint pupils), decreased consciousness, and sometimes hypotension. Naloxone is the antidote. Which substances are associated with the classic 'anticholinergic toxicidrome'? Substances such as antihistamines, atropine, scopolamine, tricyclic antidepressants, and certain plants like Jimson weed cause anticholinergic symptoms like dry skin, urinary retention, altered mental status, and tachycardia. What is the role of activated charcoal in toxicology management? Activated charcoal adsorbs

many ingested toxins if administered within an hour of ingestion, reducing absorption. It is not effective for all substances, such as hydrocarbons or heavy metals. How do tricyclic antidepressant overdoses typically present, and what is their management? Presentation includes anticholinergic effects, cardiac conduction abnormalities like widened QRS, and seizures. Management involves supportive care, sodium bicarbonate for cardiac toxicity, and monitoring in a critical care setting. What are the indications for chelation therapy in toxicology? Chelation therapy is indicated in heavy metal poisoning (e.g., lead, mercury, arsenic) when levels are elevated and clinical symptoms are present. Agents include EDTA, dimercaprol, penicillamine, and succimer. What are the main features of serotonin syndrome, and which drugs can cause it? Serotonin syndrome presents with mental status changes, autonomic hyperactivity (tachycardia, hypertension), and neuromuscular hyperactivity (hyperreflexia, clonus). It can be caused by SSRIs, SNRIs, MAO inhibitors, and certain recreational drugs like MDMA. **Comprehensive Review of 2,000 Toxicology Board Review Questions: An Essential Resource for Aspiring Toxicologists** --- Introduction Preparing for the toxicology board certification exam can be an intimidating journey, demanding a thorough understanding of complex concepts, extensive memorization, and critical thinking skills.
