air conditioning ac split systems experience a drop in their coefficient of performance cop in response to the hot ambient conditions since their condensation and the ambient temperatures are directly linked research is conducted to determine the enhancement in the cop and the energy savings that could be brought to the split ac unit while using a direct spray evaporative cooling system the study focuses on the minimization of water use to cool the condenser by utilizing the wasted condensate drain synchronizing the water injection with on off compressor operation and determining the optimal hourly periods to achieve a required reduction in the energy consumption the condensate water of the split unit is collected on daily basis and sprayed during the optimized periods at the condenser inlet to drop the temperature of the entering air experiments were conducted inside environmental chambers to determine the effectiveness of the evaporative cooling system at different ambient conditions the experiments were intended to come up with correlations that can predict the outlet air conditions after the spray and the water consumption in terms of the inlet air conditions a split ac system is modeled and simulated using steady state performance data supplied by the manufacturer yet taking into consideration both the transient effect at start up and the manufacturer s minimum on off timing moreover a living space model was

developed to predict the thermal and moisture profiles in response to internal and external loads to this end both the ac and the space models were integrated and validated by experimentations in environmentally controlled chambers the model was used to simulate the thermal conditions and energy demand of a typical office space in beirut during three distant summer months june august and october while integrating both the conventional and evaporative cooling operations of the split ac unit the simulation results showed that the drained water would be sufficient in october resulting in 5 7 of energy saving throughout the whole day on the other hand the synchronized spray of water was found to last for six and eight optimal spraying hours only during june and august respectively with maximum savings in the compressor energy consumption this resulted in a total daily reduction in the consumed energy of 5 in june and 4 5 in august
