for the past two decades complexity has informed a range of work across the social sciences there are diverse schools of complexity thinking and authors have used these ideas in a multiplicity of ways from health inequalities to the organization of large scale firms some understand complexity as emergence from the rule based interactions of simple agents and explore it through agent based modelling others argue against such restricted complexity and for the development of case based narratives deploying a much wider set of approaches and techniques major social theorists have been reinterpreted through a complexity lens and the whole methodological programme of the social sciences has been recast in complexity terms in four parts this book seeks to establish the state of the art of complexity informed social science as it stands now examining the key issues in complexity theory the implications of complexity theory for social theory the methodology and methods of complexity theory complexity within disciplines and fields it also points ways forward towards a complexity informed social science for the twenty first century investigating the argument for a post disciplinary open social science byrne

starting with cook s pioneering work on np completeness in 1970 polynomial complexity theory the study of polynomial time com putability has quickly emerged as the new foundation of algorithms on the one hand it bridges the gap between the abstract approach of recursive function theory and the concrete approach of analysis of algorithms it extends the notions and tools of the theory of computability to provide a solid theoretical foundation for the study of computational complexity of practical problems in addition the theoretical studies of the notion of polynomial time tractability some times also yield interesting new practical algorithms a typical exam ple is the application of the ellipsoid algorithm to combinatorial op timization problems see for example lovasz 1986 on the other hand it has a strong influence on many different branches of mathe matics including combinatorial optimization graph theory number theory and cryptography as a consequence many researchers have begun to re examine various branches of classical mathematics from the complexity point of view for a given nonconstructive existence theorem in classical mathematics one would like to find a constructive proof which admits a polynomial time algorithm for the solution one of the examples is the recent work on algorithmic theory of per mutation groups in the area of numerical computation there are also two tradi tionally independent approaches recursive analysis and numerical analysis

computational complexity theory is the study of how much of a given resource is required to perform the computations that interest us the most four decades of fruitful research have produced a rich and subtle theory of the relationship between different resource measures and problems at the core of the theory are some of the most alluring open problems in mathematics this book presents three weeks of lectures from the ias park city mathematics institute summer school on computational complexity the first week gives a general introduction to the field including descriptions of the basic mo

the algorithmic solution of problems has always been one of the major concerns of mathematics for a long time such solutions were based on an intuitive notion of algorithm it is only in this century that metamathematical problems have led to the intensive search for a precise and sufficiently general formalization of the notions of computability and algorithm in the 1930s a number of quite different concepts for this purpose were pro posed such as turing machines while programs recursive functions markov algorithms and thue systems all these concepts turned out to be equivalent a fact summarized in church s thesis which says that the resulting definitions form an adequate formalization of the intuitive notion of computability this had and continues to have an enormous effect first of all with these notions it has been possible to prove that various problems are algorithmically unsolvable among of group these undecidable problems are the halting problem the word problem theory the post correspondence problem and hilbert s tenth problem secondly concepts like turing machines and while programs had a strong influence on the development of the first computers and programming languages in the era of digital computers the question of finding efficient solutions to algorithmically solvable problems has become increasingly important in addition the fact that some problems can be solved very efficiently while others seem to defy all attempts to find an efficient solution has called for a deeper under standing of the intrinsic computational difficulty of problems
