this work is devoted to the analysis of high frequency solutions to the equations of nonlinear elasticity in a half space the authors consider surface waves or more precisely rayleigh waves arising in the general class of isotropic hyperelastic models which includes in particular the saint venant kirchhoff system work has been done by a number of authors since the 1980s on the formulation and well posedness of a nonlinear evolution equation whose exact solution gives the leading term of an approximate rayleigh wave solution to the underlying elasticity equations this evolution equation which is referred to as the amplitude equation is an integrodifferential equation of nonlocal burgers type the authors begin by reviewing and providing some extensions of the theory of the amplitude equation the remainder of the paper is devoted to a rigorous proof in 2d that exact highly oscillatory rayleigh wave solutions u◻ to the nonlinear elasticity equations exist on a fixed time interval independent of the wavelength ◻ and that the approximate rayleigh wave solution provided by the analysis of the amplitude equation is indeed close in a precise sense to u◻ on a time interval independent of ◻ this paper focuses mainly on the case of rayleigh waves that are pulses which have profiles with continuous fourier spectrum but the authors method applies equally well to the case of wavetrains whose fourier spectrum is discrete

this book consists of a number of papers regarding the thermodynamics and structure of multicomponent systems that we have published during the last decade even though they involve different topics and different systems they have something in common which can be considered as the signature of the present book first these papers are concerned with difficult or very nonideal systems i e systems with very strong interactions e g hyd gen bonding between components or systems with large differences in the partial molar v umes of the components e g the aqueous solutions of proteins or systems that are far from normal conditions e g critical or near critical mixtures second the conventional th modynamic methods are not sufficient for the accurate treatment of these mixtures last but not least these systems are of interest for the pharmaceutical biomedical and related ind tries in order to meet the thermodynamic challenges involved in these complex mixtures we employed a variety of traditional methods but also new methods such as the fluctuation t ory of kirkwood and buff and ab initio quantum mechanical techniques the kirkwood buff kb theory is a rigorous formalism which is free of any of the proximations usually used in the thermodynamic treatment of multicomponent systems this theory appears to be very fruitful when applied to the above mentioned difficult systems
