the implicit function theorem is one of the most important theorems in analysis and its many variants are basic tools in partial differential equations and numerical analysis this second edition of implicit functions and solution mappings presents an updated and more complete picture of the field by including solutions of problems that have been solved since the first edition was published and places old and new results in a broader perspective the purpose of this self contained work is to provide a reference on the topic and to provide a unified collection of a number of results which are currently scattered throughout the literature updates to this edition include new sections in almost all chapters new exercises and examples updated commentaries to chapters and an enlarged index and references section

homotopy analysis method in nonlinear differential equations presents the latest developments and applications of the analytic approximation method for highly nonlinear problems namely the homotopy analysis method ham unlike perturbation methods the ham has nothing to do with small large physical parameters in addition it provides great freedom to choose the equation type of linear sub problems and the base functions of a solution above all it provides a convenient way to guarantee the convergence of a solution this book consists of three parts part i provides its basic ideas and theoretical development part ii presents the ham based mathematica package bvph 1 0 for nonlinear boundary value problems and its applications part iii shows the validity of the ham for nonlinear pdes such as the american put option and resonance criterion of nonlinear travelling waves new solutions to a number of nonlinear problems are presented illustrating the originality of the ham mathematica codes are freely available online to make it easy for readers to understand and use the ham this book is suitable for researchers and postgraduates in applied mathematics physics nonlinear mechanics finance and engineering dr shijun liao a distinguished professor of shanghai jiao tong university is a pioneer of the ham

this manual contains completely worked out solutions for all the odd numbered exercises in the text

this book presents important contributions to modern theories concerning the distribution theory applied to convex analysis convex functions functions of lower semicontinuity the subdifferential of a convex function the authors prove several basic results in distribution theory and present ordinary differential equations and partial differential equations by providing generalized solutions in addition the book deals with sobolev spaces which presents aspects related to variation problems such as the stokes system the elasticity system and the plate equation the authors also include approximate formulations of variation problems such as the galerkin method or the finite element method the book is accessible to all scientists and it is especially useful for those who use mathematics to solve engineering and physics problems the authors have avoided concepts and results contained in other books in order to keep the book comprehensive furthermore they do not present concrete simplified models and pay maximal attention to scientific rigor
