review of the empirical evidence of the return to consumers on their ongoing investment into high drug prices in order to increase future innovation the implicit critical and unrealistic assumption inherent in these studies is identified namely that the health budget can be expanded to purchase drugs at higher prices without an opportunity cost for example the foregone benefits of alternative investments in health care infrastructure price effectiveness analysis pea is introduced pea informs the question of how the innovative surplus from the new drug should be allocated between the manufacturer and the consumer so as to optimise society's welfare the method allows the decisions by the regulator and the firm to be analysed jointly by specifying the firm's production and revenue functions in terms of the clinical innovation of a new drug the incremental effect used in the summary metric of cost effectiveness analysis an economic value of innovation that takes into account opportunity cost under conditions of economic efficiency in the health system is proposed the health shadow price the limitations of the non strategic methods that currently inform the highly contested new drug subsidy game are presented and the relative strengths of pea are demonstrated health technology assessment quantifies both the clinical innovation of a new drug and its financial impact on the health system cost effectiveness analysis tests the relationship between the incremental cost and incremental effect of a new drug for target patients at a given price pea tests the relationship between the price of a new drug and the health of the whole population now and into the future it achieves this by taking into account current inefficiency in both resource allocation and the displacement process and the relationship between price and future innovation
