aeronautics is defined as the science that treats of the operation of aircraft also the art or science of operating aircraft basically with aeronautics one is concerned with predicting and controlling the forces and moments on an aircraft that is traveling through the atmosphere a single comprehensive in depth treatment of both basic and applied modern aerodynamics the fluid mechanics and aerodynamics of incompressible and compressible flows with particular attention to the prediction of lift and drag characteristics of airfoils and wings and complete airplane configurations designed for courses in aerodynamics aeronautics and flight mechanics this text examines the aerodynamics propulsion performance stability and control of an aircraft this book captures some of the new technologies and methods that are currently being developed to enable sustainable air transport and space flight it clearly illustrates the multi disciplinary character of aerospace engineering and the fact that the challenges of air transportation and space missions continue to call for the most innovative solutions and daring concepts

the design development analysis and evaluation of new aircraft technologies such as fly by wire unmanned aerial vehicles and micro air vehicles necessitate a better understanding of flight mechanics on the part of the aircraft systems analyst a text that provides unified coverage of aircraft flight mechanics and systems concept will go a lon

a single comprehensive in depth treatment of both basic and applied modern aerodynamics covers the fluid mechanics and aerodynamics of incompressible and compressible flows with particular attention to the prediction of lift and drag characteristics of airfoils and wings and complete airplane configurations following an introduction to propellers piston engines and turbojet engines methods are presented for analyzing the performance of an airplane

aircraft operating as so called high altitude platform systems haps have been considered as a complementary technology to satellites since several years these aircraft can be used for similar communication and monitoring tasks while operating at a fraction of the cost such concepts have been successfully tested those include the aerovironment helios and the airbus zephyr with an endurance of nearly 624 hours 26 days all these haps aircraft have a high aspect ratio wing using lightweight construction in gusty atmosphere this results in high bending moments and high structural loads which can lead to overloads aircraft crashes for example from google s solara 50 or facebook s aquila give proof of that fact especially in the troposphere where the active weather takes place gust loads occur which can lead to the destruction of the structure the airbus zephyr the only haps aircraft without flight accidents provides only a very small payload thus it does not fully comply with the requirements for future haps aircraft to overcome the shortcomings of such single wing aircraft so called multibody aircraft are considered to be an alternative the concept assumes multiple aircraft connected to each other at their wingtips it goes back to the german engineer dr vogt in the united states shortly after the end of world war ii he experimented with the coupling of manned aircraft this resulted in a high aspect ratio wing for the aircraft formation the range of the formation could be increased correspondingly the engineer geoffrey s sommer took up vogt s idea and patented an aircraft configuration consisting of several unmanned aerial vehicles coupled at their wingtips however the patent does not provide any insight into the flight performance the flight mechanical modeling or the control of such an aircraft single publications exist that deal with the performance of coupled aircraft a profound complete analysis however is missing so far this is where the present work starts for the first time a flying vehicle based on the concept of the multibody aircraft will be analyzed in terms of flight mechanics and flight control in a performance analysis the aircraft concept is analyzed in detail and the benefits in terms of bending moments and flight performance are clearly highlighted limits for operation in flight are shown considering aerodynamic optimal points the joints at the wingtips allow a roll and pitch motion of the individual aircraft this results in additional degrees of freedom for the design through the implementation of different relative pitch and bank angles for example using individual pitch angles for individual aircraft further decreases the induced

drag and increases flight performance because the lift is distributed symmetrically but not homogeneously along the wingspan a lateral trim of the individual aircraft in formation flight becomes necessary the thesis presents a new method to implement this trim by moving the battery mass along half the wingspan which avoids additional parasite drag further a complete flight dynamics model is provided and analyzed for aircraft that are mechanically connected at their wingtips to study this model in detail a hypothetical torsional and bending spring between the aircraft is introduced if the spring constants are very high the flight dynamics model has properties similar to those of an elastic aircraft rigid body and formation eigenmotions can be clearly distinguished if the spring constants are reduced towards zero which represents the case of the multibody aircraft classical flight mechanics eigenmotions and modes resulting from the additional degrees of freedom are coupled this affects the eigenstructure of the aircraft hence normal motions with respect to the inertial space as known from a rigid aircraft cannot be observed anymore the plant also reveals unstable behavior using the non linear flight dynamics model flight controllers are designed to stabilize the plant and provide the aircraft with an eigenstructure similar to conventional aircraft different controller design methods are used the flight controller shall further maintain a determined shape of the flight formation it shall control flight bank and pitch angles and it shall suppress disturbances flight control theories in the time domain eigenstructure assignment and in the frequency domain  $h$  infinity loop shaping are considered the resulting inner control loops yield a multibody aircraft behavior that is similar to the one of a rigid aircraft for the outer control loops classical autopilot concepts are applied overall the flight trajectory of the multibody aircraft above ground is controlled and thus an actual operation as haps is possible in the last step the flight controller is successfully validated in non linear simulations with complete flight dynamics flugzeuge in der form von sogenannten höhenplattformen engl high altitude platform systems haps werden seit einigen jahren als kostengünstige ergänzung zu teuren satelliten betrachtet diese flugzeuge können für ähnliche kommunikations und überwachungsaufgaben eingesetzt werden zu den gegenwärtigen konzepten solcher fluggeräte die bereits erfolgreich im flugversuch eingesetzt wurden zählen der helios von aerovironment und der airbus zephyr der eine flugdauer von fast 624 stunden 26 tagen erreicht hat alle diese haps flugzeuge besitzen einen flügel langer streckung der in leichtbauweise konstruiert ist hieraus resultieren in böiger atmosphäre hohe biegemomente und starke strukturelle belastungen die zu überbelastungen
