network flow theory has been used across a number of disciplines including theoretical computer science operations research and discrete math to model not only problems in the transportation of goods and information but also a wide range of applications from image segmentation problems in computer vision to deciding when a baseball team has been eliminated from contention this graduate text and reference presents a succinct unified view of a wide variety of efficient combinatorial algorithms for network flow problems including many results not found in other books it covers maximum flows minimum cost flows generalized flows multicommodity flows and global minimum cuts and also presents recent work on computing electrical flows along with recent applications of these flows to classical problems in network flow theory

the goal of the encyclopedia of optimization is to introduce the reader to a complete set of topics that show the spectrum of research the richness of ideas and the breadth of applications that has come from this field the second edition builds on the success of the former edition with more than 150 completely new entries designed to ensure that the reference addresses recent areas where optimization theories and techniques have advanced particularly heavy attention resulted in health science and transportation with entries such as algorithms for genomics optimization and radiotherapy treatment design and crew scheduling

this open access book gives an overview of cutting edge work on a new paradigm called the sublinear computation paradigm which was proposed in the large multiyear academic research project foundations of innovative algorithms for big data that project ran from october 2014 to march 2020 in japan to handle the unprecedented explosion of big data sets in research industry and other areas of society there is an urgent need to develop novel methods and approaches for big data analysis to meet this need innovative changes in algorithm theory for big data are being pursued for example polynomial time algorithms have thus far been regarded as fast but if a quadratic time algorithm is applied to a petabyte scale or larger big data set problems are encountered in terms of computational resources or running time to deal with this critical computational and algorithmic bottleneck linear sublinear and constant time algorithms are required the sublinear computation paradigm is proposed here in order to support innovation in the big data era a foundation of innovative algorithms has been created by developing computational procedures data structures and modelling techniques for big data the project is organized into three teams that focus on sublinear algorithms sublinear data structures and sublinear modelling the work has provided high level academic research results of strong computational and algorithmic interest which are presented in this book the book consists of five parts part i which consists of a single chapter on the concept of the sublinear computation paradigm parts ii iii and iv review results on sublinear algorithms sublinear data structures and sublinear modelling respectively part v presents application results the information presented here will inspire the researchers who work in the field of modern algorithms
