the world of deaf infants presents the results of a 15 year research study that has explored the impact of infant deafness on infant development on the families that support these children

this landmark collective work introduces the physical chemical and biological principles underlying photosynthesis light absorption excitation energy transfer and charge separation it begins with an introduction to properties of various pigments and the pigment proteins in plant algae and bacterial systems it addresses the underlying physics of light harvesting and key spectroscopic methods including data analysis it discusses assembly of the natural system its energy transfer properties and regulatory mechanisms it also addresses light harvesting in artificial systems and the impact of photosynthesis on our environment the chapter authors are amongst the field s world recognized experts chapters are divided into five main parts the first focused on pigments their properties and biosynthesis and the second section looking at photosynthetic proteins including light harvesting in higher plants algae cyanobacteria and green bacteria the third part turns to energy transfer and electron transport discussing modeling approaches quantum aspects photoinduced electron transfer and redox potential modulation followed by a section on experimental spectroscopy in light harvesting research the concluding final section includes chapters on artificial photosynthesis with topics such as use of cyanobacteria and algae for sustainable energy production

chloroplasts and mitochondria both have a prokaryotic origin carry essential genes on their own highly reduced genome and generate energy in the form of atp for the plant cell the ion composition and concentration in these bioenergetic organelles impact photosynthesis respiration and stress responses in plants early electrophysiological and biochemical studies provided strong evidence for the presence of ion channels and ion transporters in chloroplast and mitochondrial membranes however it wasn t until the last decade that the development of model organisms such as arabidopsis thaliana and chlamydomonas reinhardtii along with improved genetic tools to study cell physiolgy have led to the discovery of several genes encoding for ion transport proteins in chloroplasts and mitochondria for the first time these discoveries have enabled detailed studies on the essential physiological function of the organellar ion flux this research topic welcomed updated overviews and comprehensive investigations on already identified and novel ion transport components involved in physiology of chloroplasts and mitochondria in green organisms
