over the last 15 years or so there has been a huge increase in the popularity of astrophotography with the advent of digital slr cameras and ccd imagers these have enabled astronomers to take many images and indeed check images as they scan the skies processing techniques using computer software have also made developing these images more accessible to those of us who are chemically challenged and let s face it some of the pictures you see these days in magazines books and on popular web forums are frankly amazing so why bother looking through the eyepiece you ask well for one thing setting up the equipment is quicker you just take your scope out of the garage or if you re lucky enough to own one open the roof of your observatory align the scope and off you go if you have an equatorial mount you ll still need to roughly polar align but this really takes only a

few moments the imager would most likely need to spend more time setting up this would include very accurate polar alignment for equatorial mounts then finding a guide star using his or her finder checking the software is functioning properly and continuous monitoring to make sure the alignment is absolutely precise through the imaging run that said an imager with a snug obsy at the end of the garden will have a quicker time setting up but then again so will the visual observer
