**FAQs**

1. What is the difference between a saturated and an unsaturated solution? A saturated solution is a solution where the maximum amount of solute has dissolved in the solvent at a given temperature. No more solute can dissolve in this solution, and any additional solute will simply settle to the bottom. An unsaturated solution, on the other hand, is a solution that can still dissolve more solute at a given temperature.
2. How does temperature affect solubility? Generally, increasing the temperature of a solution increases the solubility of most solid solutes. This is because higher temperatures provide more kinetic energy to the solute molecules, allowing them to overcome intermolecular forces and dissolve more effectively. However, there are exceptions to this rule, and some substances, like gases, become less soluble as temperature increases.
3. What is the role of polarity in solubility? Polarity plays a crucial role in determining solubility. The like dissolves like principle states that polar solutes tend to dissolve in polar solvents, while nonpolar solutes dissolve best in nonpolar solvents. This is because polar molecules have strong intermolecular forces, like hydrogen bonds, that can form with other polar molecules. Similarly, nonpolar molecules have weak van der Waals forces that are best satisfied by interactions with other nonpolar molecules.
4. How can supersaturated solutions be created? Supersaturated solutions are created by dissolving more solute than what would normally dissolve at a given temperature. This is typically achieved by carefully heating a solution to dissolve a large amount of solute and then slowly cooling it down. The process requires precise conditions and often involves adding seed crystals to initiate crystallization once the solution is cooled.
5. What are some

practical applications of solubility Solubility has numerous practical applications in various fields Pharmaceuticals Understanding solubility is crucial for drug development and delivery The solubility of a drug determines its bioavailability which is its ability to be absorbed by the body and reach its target site Environmental Chemistry Solubility plays a vital role in understanding the fate and transport of pollutants in the environment For example the solubility of pesticides in water determines their potential for leaching into groundwater Food Science Solubility influences the texture taste and stability of food products For instance the solubility of sugars in water determines the sweetness and viscosity of beverages Chemical Engineering Solubility is critical in chemical processes such as crystallization extraction and distillation It determines the efficiency of these processes and the purity of the final products By exploring these practical applications we realize that the seemingly simple act of dissolving has farreaching implications in our world

charlie's first publication on the subject in 1967 has been enormous this growth is evidenced in one segment of the field by the three fold increase in the number of references in two chemical reviews articles on thermodynamic quantities associated with cation macrocycle interaction authored by us in 1985 and 1991 charlie lived to see much of this growth he saw many of his own predictions of possible uses of crown ethers and related macrocycles realized recognition for charlie came late in his career he found it satisfying to see so many capable scientists go in so many directions as they applied his discovery to a wide range of chemical and other fields he made seminal contributions to the broad area known today as molecular recognition his work illustrates how one individual can make an enormous difference in science the effect of his life and work on those of us who contributed papers for this issue and on many others is appreciated and is acknowledged by several of the authors in their individual papers it is entirely appropriate to honor his memory with this special issue r m izatt j s bradshaw department of chemistry brigham young university provo ut 84602 u s a reprinted from journal of inclusion phenomena and molecular recognition in chemistry volume 12 nos 1 4 1992
