Solutions Problem 1 A car accelerates from rest to a speed of 30 ms in 10 seconds What is the car's acceleration **Solution** We can use the equation $a = \frac{v - u}{t}$ Where a acceleration v final velocity 30 ms u initial velocity 0 ms t time 10 s 3 Substituting these values $a = \frac{30 - 0}{10} = 3 \text{ ms}$ Therefore the car's acceleration is 3 ms

Problem 2 A ball is thrown vertically upward with an initial velocity of 20 ms How high does the ball go **Solution** At the highest point the ball's final velocity will be 0 ms We can use the equation $v^2 = u^2 + 2as$ Where v final velocity 0 ms u initial velocity 20 ms a acceleration due to gravity -9.8 ms s displacement height Substituting the values $0 = 20^2 + 2(-9.8)s$ Solving for s we get $s = 20.4 \text{ m}$ Therefore the ball goes approximately 20.4 meters high

Problem 3 A 10 kg box is pushed across a horizontal surface with a force of 50 N The coefficient of kinetic friction between the box and the surface is 0.2 What is the acceleration of the box **Solution** First we need to calculate the force of friction $F_{\text{friction}} = \mu_k F_{\text{normal}}$ Where μ_k coefficient of kinetic friction 0.2 F_{normal} normal force equal to the weight of the box $10 \text{ kg} \times 9.8 \text{ ms} = 98 \text{ N}$ Therefore $F_{\text{friction}} = 0.2 \times 98 \text{ N} = 19.6 \text{ N}$ Now we can find the net force acting on the box $F_{\text{net}} = F_{\text{applied}} - F_{\text{friction}} = 50 \text{ N} - 19.6 \text{ N} = 30.4 \text{ N}$ Finally we can use Newton's second law to find the acceleration $a = \frac{F_{\text{net}}}{m} = \frac{30.4 \text{ N}}{10 \text{ kg}} = 3.04 \text{ ms}$ Therefore the acceleration of the box is 3.04 ms

Problem 4 A 2 kg object is moving with a velocity of 4 ms A constant force of 10 N is applied to the object for 3 seconds What is the final velocity of the object **Solution** We can use the equation $v = u + at$ Where v final velocity u initial velocity 4 ms a acceleration $\frac{F}{m} = \frac{10 \text{ N}}{2 \text{ kg}} = 5 \text{ ms}$ t time 3 s Substituting the values $v = 4 + 5 \times 3 = 19 \text{ ms}$ Therefore the final velocity of the object is 19 ms

Problem 5 A 5 kg

block is released from rest at the top of a frictionless incline that is 10 meters long and makes an angle of 30 degrees with the horizontal. What is the speed of the block at the bottom of the incline? Solution: We can use the conservation of energy principle. At the top of the incline, the block has potential energy and no kinetic energy. At the bottom, the potential energy is converted to kinetic energy. Potential energy at the top: $PE_{\text{top}} = mgh$. Kinetic energy at the bottom: $KE_{\text{bottom}} = \frac{1}{2}mv^2$. Where m is the mass of the block (5 kg), g is the acceleration due to gravity (9.8 m/s²), h is the height of the incline (10 m $\sin 30^\circ = 5$ m), and v is the velocity at the bottom. Setting PE_{top} equal to KE_{bottom} : $5 mgh = \frac{1}{2}mv^2$. Solving for v : $v = \sqrt{2gh} = \sqrt{2 \cdot 9.8 \cdot 5} = 9.9$ m/s. Therefore, the speed of the block at the bottom of the incline is approximately 9.9 m/s.

Problem 6: A 2 kg object is moving with a velocity of 5 m/s. A 3 kg object is moving with a velocity of 2 m/s. What is the velocity of the center of mass of the system? Solution: The velocity of the center of mass V_{cm} is given by $V_{\text{cm}} = \frac{m_1 v_1 + m_2 v_2}{m_1 + m_2}$. Where m_1 is the mass of the first object (2 kg), v_1 is the velocity of the first object (5 m/s), m_2 is the mass of the second object (3 kg), and v_2 is the velocity of the second object (2 m/s). Substituting the values: $V_{\text{cm}} = \frac{2 \cdot 5 + 3 \cdot 2}{2 + 3} = \frac{10 + 6}{5} = 3.2$ m/s. Therefore, the velocity of the center of mass of the system is 3.2 m/s.

Problem 7: A 10 kg object is moving with a constant velocity of 4 m/s. What is the net force acting on the object? Solution: Newton's first law states that an object at rest stays at rest and an object in motion stays in motion with the same speed and in the same direction unless acted upon by an unbalanced force. Since the object is moving with constant velocity, it means there is no net force acting on it. Therefore, the net force acting on the object is 0 N.

Problem 8: A 5 kg object is suspended from a vertical spring. The spring stretches 10 cm when the object is attached. What is the spring constant of the spring? Solution: We can use Hooke's Law: $F = kx$. Where F is the force exerted by the spring, k is the spring constant, and x is the displacement from equilibrium (10 cm = 0.1 m). The force exerted by the spring is equal to the weight of the object: $F = mg = 5 \text{ kg} \cdot 9.8 \text{ m/s}^2 = 49 \text{ N}$. Substituting the values in Hooke's Law: $49 \text{ N} = k \cdot 0.1 \text{ m}$. Solving for k : $k = \frac{49 \text{ N}}{0.1 \text{ m}} = 490 \text{ N/m}$. Therefore, the spring constant of the spring is 490 N/m.

Problem 9: A 2 kg object is dropped from a height of 10 meters. What is the speed of the object just before it hits the ground? Solution: We can use the equation $v^2 = u^2 + 2as$. Where v is the final velocity (what we want to find), u is the initial velocity (0 m/s), a is the acceleration due to gravity (9.8 m/s²), and s is the displacement (10 m). Substituting the values: $v^2 = 0^2 + 2 \cdot 9.8 \cdot 10$. $v = \sqrt{196} = 14$ m/s. Therefore, the speed of the object just before it hits the ground is approximately 14 m/s.

Problem 10: A 10 kg object is placed on a frictionless surface. A constant force of 20 N is applied to the object. What is the work done by the force over a distance of 5 meters? Solution: The work done by a force is given by $W = Fd \cos \theta$. Where W is the work done, F is the force (20 N), d is the displacement (5 m), and θ is the angle between the force and displacement (0 degrees). Substituting the values: $W = 20 \text{ N} \cdot 5 \text{ m} \cdot \cos 0^\circ = 100 \text{ J}$. Therefore, the work done by the force is 100 J.

0 since the force is applied in the direction of motion Substituting the values $W = 20 \text{ N} \cdot 5 \text{ m} \cdot \cos 0 = 100 \text{ J}$ Therefore the work done by the force over a distance of 5 meters is 100 Joules Beyond the Solutions A Call to Deeper Understanding This document offers a stepping stone in your journey through Physics 121 While these solutions provide a framework for understanding mechanics true mastery comes from going beyond the surface level The joy of physics lies not only in solving problems but in delving into the underlying principles pondering their implications and finding connections to the world around you Remember every concept every equation is a doorway to a deeper understanding of the universe Explore these doors experiment with your own questions and let your curiosity guide you through the fascinating realm of physics
