2 FAQs

1 What are the main stages of cellular respiration and how do they relate to the lab experiment

The AP Biology Cellular Respiration Lab explores the first two stages of cellular respiration glycolysis and fermentation Glycolysis is the initial breakdown of glucose into pyruvate occurring in the cytoplasm while fermentation represents the anaerobic conversion of pyruvate into lactate or ethanol in the absence of oxygen The lab focuses on measuring the rate of carbon dioxide production as a proxy for the overall rate of fermentation

2 Why is the yeast used in this lab and what role does it play in cellular respiration

Yeast is a singlecelled organism that undergoes fermentation in the absence of oxygen This means it produces carbon dioxide as a byproduct of breaking down sugars In the lab yeast acts as a model system to study fermentation and the production of carbon dioxide which can be measured and correlated with the rate of cellular respiration

3 What is the role of the spectrophotometer in the experiment and how does it relate to measuring cellular respiration

The spectrophotometer is used to measure the absorbance of light by a solution In the lab the absorbance of a solution containing a pH indicator is correlated with the amount of carbon dioxide produced by the yeast Since carbon dioxide production is a direct indicator of the rate of fermentation the spectrophotometer indirectly measures the rate of cellular respiration

4 How do different substrates affect the rate of cellular respiration and what does this tell us about the process

The experiment investigates the effect of different sugars like glucose and sucrose on the rate of fermentation The results demonstrate that different substrates have varying efficiencies in fueling cellular respiration This showcases the specificity of enzymes involved in the process and highlights the intricate relationship between substrate availability and metabolic rate

5 What are the potential sources of error in the AP Biology Cellular Respiration Lab and how can they be mitigated

Possible sources of error include

variations in temperature inconsistencies in yeast concentration and inaccurate measurement of solutions These errors can be mitigated by controlling temperature carefully preparing yeast solutions and using accurate measuring 3 equipment Repeating the experiment with multiple trials can also enhance the reliability of the results
