computational economics a concise introduction is a comprehensive textbook designed to help students move from the traditional and comparative static analysis of economic models to a modern and dynamic computational study the ability to equate an economic problem to formulate it into a mathematical model and to solve it computationally is becoming a crucial and distinctive competence for most economists this vital textbook is organized around static and dynamic models covering both macro and microeconomic topics exploring the numerical techniques required to solve those models a key aim of the book is to enable students to develop the ability to modify the models themselves so that using the matlab octave codes provided on the book and on the website students can demonstrate a complete understanding of computational methods this textbook is innovative easy to read and highly focused providing students of economics with the skills needed to understand the essentials of using numerical methods to solve economic problems it also provides more technical readers with an easy way to cope with economics through modelling and simulation later in the book more elaborate economic models and advanced numerical methods are introduced which will prove valuable to those in more advanced study this book is ideal for all students of economics mathematics computer science and engineering taking classes on computational or numerical economics

this book identifies the economic as well as financial problems that may be solved efficiently with computational methods and explains why those problems should best be solved with computational methods provided by publisher

the ability to conceptualize an economic problem verbally to formulate it as a mathematical model and then represent the mathematics in software so that the model can be solved on a computer is a crucial skill for economists computational economics contains well known models and some brand new ones designed to help students move from verbal to mathematical to computational representations in economic modeling the authors focus however is not just on solving the models but also on developing the ability to modify them to reflect one's interest and point of view the result is a book that enables students to

be creative in developing models that are relevant to the economic problems of their times unlike other computational economics textbooks this book is organized around economic topics among them macroeconomics microeconomics and finance the authors employ various software systems including matlab mathematica gams the nonlinear programming solver in excel and the database systems in access to enable students to use the most advantageous system the book progresses from relatively simple models to more complex ones and includes appendices on the ins and outs of running each program the book is intended for use by advanced undergraduates and professional economists and even as a first exposure to computational economics by graduate students organized by economic topics progresses from simple to more complex models includes instructions on numerous software systems encourages customization and creativity

the field of computational economics is a fast growing area due to the limitations in analytical modeling more and more researchers apply numerical methods as a means of problem solving in turn these quantitative results can be used to make qualitative statements this volume of the advanced series in theoretical and applied and econometrics comprises a selected number of papers in the field of computational economics presented at the annual meeting of the society economic dynamics and control held in minneapolis june 1990 the volume covers ten papers dealing with computational issues in econometrics economics and optimization the first five papers in these proceedings are dedicated to numerical issues in econometric estimation the following three papers are concerned with computational issues in model solving and optimization the last two papers highlight some numerical techniques for solving micro models we are sure that computational economics will become an important new trend in economics in the coming decade hopefully this volume can be one of the first contributions highlighting this new trend the editors h m amman et al eds computational economics and econometrics vii 1992 kluwer academic publishers part one econometrics likelihood evaluation for dynamic latent variables 1 models david f hendry nuffield college oxford u k and jean franc ms richard isds pittsburgh university pittsburgh pa u s a

this book aims to answer two questions that are fundamental to the study of agent based economic models what is agent based computational economics and why do we need agent based economic modelling of economy this book provides a review of the development of agent based computational economics ace from a perspective on how artificial economic agents are designed under the influences of complex sciences experimental economics artificial intelligence evolutionary biology psychology anthropology and neuroscience this book begins with a

historical review of ace by tracing its origins from a modelling viewpoint ace brings truly decentralized procedures into market analysis from a single market to the whole economy this book also reviews how experimental economics and artificial intelligence have shaped the development of ace for the former the book discusses how ace models can be used to analyse the economic consequences of cognitive capacity personality and cultural inheritance for the latter the book covers the various tools used to construct artificial adaptive agents including reinforcement learning fuzzy decision rules neural networks and evolutionary computation this book will be of interest to graduate students researching computational economics experimental economics behavioural economics and research methodology
