visual perception explores fundamental topics underlying the field of visual perception including the perception of brightness and color the physics of light and the optics of the eye although the text leans heavily on physical and physiological concepts explanations of the relevant physics and physiology are considered this book is organized into 16 chapters and begins with an overview of the relationship between information assimilation and the physiology of the visual system based on data gathered both in physiological and perceptual experiments more specifically this text discusses the nature of the human perceptual system in terms of the kinds of information that are assimilated from the world and how this selection of information is governed by the structure of receptors and the neural circuits that are connected to them the relationships between symbols and their corresponding physical and physiological variables are also examined finally the book addresses the presence of strong lateral inhibition in the visual system and how it fits the concept of evolution this book is aimed at undergraduate and graduate students regardless of their academic backgrounds

this is a book about how we see the environment around us its surfaces their layout and their colors and textures where we are in the environment whether or not we are moving and if we are where we are going what things are good for how to do things to thread a needle or drive an automobile or why things look as they do the basic assumption is that vision depends on the eye which is connected to the brain the author suggests that natural vision depends on the eyes in the head on a body supported by the ground the brain being only the central organ of a complete visual system when no constraints are put on the visual system people look around walk up to something interesting and move around it so as to see it from all sides and go from one vista to another that is natural vision and what this book is about

vision is about insight and visual perception is about cognition and they form the foundation of how we see the world duco a schreuder a physicist and psychologist explores the finer details of each in this groundbreaking book that explores human consciousness and perception sharing virtually everything he s learned over a varied career spanning more than sixty years he examines a wide array of topics including how we understand what we visually process how we store and retrieve information the role that neurons play in how what we see and much more while schreuder isn t afraid to disagree with other leading thinkers he relies on science and focuses on the facts behind it so you can understand lighting visual perception engineering design and applied and experimental physics looking is about insight whereas seeing is about knowledge and you need to know how each one works to truly understand how humanity views the world whether you re an illuminating engineer considering the fundamentals of the trade or a student or professional in an allied discipline you ll be well served by taking a closer look at vision and visual perception

does the world appear the same to everyone does what we know determine what we see why do we see the world as we do vision is our most dominant sense from the light that enters our eyes to the complex cognitive processes that follow we derive most of our information about what things are where they are and how they move from our vision visual perception takes a refreshingly different approach to this enigmatic sense from the function that vision serves for an active observer to the history of visual perception itself the third edition has been extensively revised updated and expanded while still preserving the essential features of historical context neurophysiology and independent thought that made the earlier editions so engaging covering the perception of location motion object recognition and with up to date information on the workings of the visual brain the 3rd edition looks at how
