because of the uneven distribution of fresh water in time and space and the increasing human population a large number of regions are experiencing water scarcity and stress membrane based desalination technologies like reverse osmosis have the potential to solve the fresh water crisis in coastal areas however in many cases membrane performance is restricted by biofouling biofouling of membrane systems gives a comprehensive overview on the state of the art strategies to control biofouling in spiral wound reverse osmosis membrane systems and point to possible future research directions despite the fact that much research and development has been done to overcome biofouling in spiral wound membrane systems used for water treatment biofouling is still a major practical problem causing performance decline and increased energy demand biofouling of membrane systems is divided into three sections including modelling and numerical analysis non destructive characterization and feed spacer geometry optimization it focuses on the development of biomass in the feed channel of the membrane module and its effect on pressure drop and hydrodynamics this book can be used to develop an integral strategy to control biofouling in spiral wound membrane systems an overview of several potential complementary approaches to solve biofouling is given and an integrated approach for biofouling control and feed spacer design is proposed

an in depth experimental study of the fluid dynamics of turbulent fluidized beds with particles of geldart s group b was carried out for this purpose fluidization behavior was investigated in different fluidized bed plants having diameters in the range of 0 05 m to 1 m pressure fluctuation analysis has been used as an identification tool for the turbulent fluidized bed regime different fluidization conditions have been

investigated by variation of the fluidized bed properties the bed material properties and the gas properties based on the measured data a correlation predicting the transition velocity from bubbling to turbulent fluidization is introduced to investigate the local flow structure capacitance probe measurements have been carried out using this measurement technique local solids concentrations and properties of rising bubbles have been determined and analyzed finally an empiric fluid dynamic model was developed using the local measurement data it is mainly based on capacitance probe measurements and shows high accuracy in comparison to pressure data

this multidisciplinary reference takes the reader through all four major phases of interdisciplinary inquiry adequate conceptualization rigorous formulation substantive interpretation and innovative implementation the text introduces a novel synthetic paradigm of public health reasoning and epidemic modelling and implements it with a study of the infamous 14th century ad black death disaster that killed at least one fourth of the european population
