The NCO21 research program was undertaken to help the U.S. Army plan for the impact of future demands on the noncommissioned officer NCO corps. The performance requirements and associated knowledge, skills, and aptitudes (KSAs) expected of future successful NCOS were used as a basis for developing tools that could be incorporated into an NCO performance management system geared to 21st century job demands. This report documents the design and development of predictor and criterion measures that will be used in a criterion-related validation data collection. The predictor measures include the Armed Services Vocational Aptitude Battery (ASVAB) assessment of individual motivation, AIM, and biographical information questionnaire (BIQ), which are operational tests already used in the Army for other purposes. A written situational judgment test (SJT), the Experience and Activities Record (EAC), personnel file form (PFF) 21, and a semi-structured interview were developed for this project. Two types of rating scale instruments were developed for gathering criterion data: the observed performance rating scales ask supervisors to rate soldiers on how well they perform in their current jobs; the expected future performance rating scales ask supervisors to predict how their soldiers would perform in specific sets of conditions expected to be characteristic of future Army requirements.

this thesis investigates a range of experimental and computational approaches for the discovery of solid forms furthermore we gain as readers a better understanding of the key factors underpinning solid structure and diversity a major part of this thesis highlights experimental work carried out on two structurally very similar compounds another important section involves looking at the influence of small changes in structure and substituents on solid structure and diversity using computational tools including crystal structure prediction pixel calculations xpac mercury and statistical modeling tools in addition the author presents a fast validated method for solid state form screening using raman microscopy on multi well plates to explore the experimental crystallization space this thesis illustrates an inexpensive practical and accurate way to predict the crystallizability of organic compounds based on molecular structure alone and additionally highlights the molecular factors that inhibit or promote crystallization
