more and more transactions whether in business or related to leisure activities are mediated automatically by computers and computer networks and this trend is having a significant impact on the conception and design of new computer applications the next generation of these applications will be based on software agents to which increasingly complex tasks can be delegated and which interact with each other in sophisticated ways so as to forge agreements in the interest of their human users the wide variety of technologies supporting this vision is the subject of this volume it summarises the european cooperation in science and technology cost action project on agreement technologies at during which approximately 200 researchers from 25 european countries along with eight institutions from non cost countries cooperated as part of a number of working groups the book is the first to provide a comprehensive overview of the emerging field of agreement technologies written and coordinated by the leading researchers in the field the results set out here are due for wide dissemination beyond the computer technology sector involving law and social science as well

numerical experiments with the barotropic vorticity equation are carried out to examine the effects of the computational resolution on the forecast accuracy within a limited region the experiments assume that wind is measured and predicted at prescribed times on a set of uniformly distributed grid points with a grid distance of about 750 km the required initial and boundary conditions for a given computational resolution are estimated through interpolation the finite difference analogue of the vorticity equation is obtained using the shuman algorithm and the leap frog scheme the time integration is extended for 12 hours the observed winds are given by the values of the rossby haurwitz waves and the forecast errors are defined by the differences between the predicted and observed values three levels of computational resolution namely the single double and quadruple resolutions are considered in which the single

resolution network coincides with the observational network two spatial interpolation procedures the bilinear and the 16 point least squares biquadratic interpolations and the linear time interpolation are used to obtain estimates of requisite initial and boundary values

most of the topics in applied mathematics dealt with in this handbook can be grouped rather loosely under the term analysis they involve results and techniques which experience has shown to be of utility in a very broad variety of applications although care has been taken to collect certain basic results in convenient form it is not the purpose of this handbook to duplicate the excellent collections of tables and formulas available in the national bureau of standards handbook of mathematical functions ams series 55 u s government printing office and in the references given therein rather the emphasis in the present handbook is on technique and we are indeed fortunate that a number of eminent applied mathematicians have been willing to share with us their interpretations and experiences to avoid the necessity of frequent and disruptive cross referencing it is expected that the reader will make full use of the index moreover each chapter has been made as self sufficient as is feasible this procedure has resulted in occasional duplication but as

compensation for this the reader may appreciate the availability of different points of view concerning certain topics of current interest as editor i would like to express my appreciation to the contributing authors to the reviewers to the editorial staff of the publisher and to the many secretaries and typists who have worked on the manuscript without the partnership of all of these people this handbook would not have been possible
