in recent years the agriculture sector has witnessed a significant transformation due to the integration of digital technologies and data driven methodologies leading to the emergence of smart agriculture advanced agricultural technologies notably high throughput phenotyping and crop modeling have fundamentally altered our understanding and management of crops phenotyping allows for precise characterization of plant traits while crop modeling provides predictive insights into crop growth and yield based on a diverse set of environmental parameters in many contexts phenotyping and modeling are closely intertwined phenotypic data forms the foundation for modeling and models offer quantifiable tools for analyzing complex traits the convergence of these domains presents an exciting opportunity to optimize agricultural practices enhance resource efficiency and make substantial contributions to global food security this research topic aims to seamlessly integrate phenotyping and modeling essential components in smart agriculture to address urgent challenges like sustainable food production amidst a growing global population and to optimize resource utilization the key challenge is the fragmented use and insufficient integration of high throughput phenotyping and advanced crop modeling the cohesive fusion of these technologies can revolutionize crop management offering predictive analytics for optimized resource allocation enhanced productivity and

environmental sustainability recent strides in sensor tech machine learning and computational modeling provide a strong foundation for a refined integration of phenotyping and modeling enabling real time data driven decisions for farmers this research strives to bridge the gap between phenotyping and crop modeling aiming for a transformative approach in smart agriculture to ensure sustainability and food security

intelligent agriculture is the inevitable trend of future agriculture as the brain of intelligent agriculture advanced sensors determine the degree of agricultural environment and crop perception however an outstanding problem is the long standing lack of effective sensing and monitoring tools in agriculture most information still relies on time consuming and complex laboratory analysis and can only be off line measured therefore in situ on line and sensitive methods for monitoring information about the agricultural environment and crops are urgently needed with the development of material science manufacturing technology and spectroscopy more and more fast and high precision spectroscopic methods and sensors are applied in the agricultural environment livestock breeding and crop especially with the development of spectral enhancement image processing and deep learning techniques the study of the advanced spectroscopic methods to rapidly and precisely detect heavy metals and nutrients in the soil harmful gas water pollutant and crop stress will reduce the probability of subjective error judgment and improves agricultural management and production efficiency application of spectroscopy in an agricultural environment and livestock breeding is a research topic of frontiers in physics that publishes original research on the field of agricultural physics and the aim of this research topic is to explore novel and groundbreaking spectroscopic methods to rapidly and in situ detect information about the agricultural environment livestock breeding and crop stress which could be beneficial in the development of intelligent agriculture
