magicians have dazzled audiences for many centuries however few researchers have studied how let alone why

most tricks work the psychology of magic is a nascent field of research that examines the underlying mechanisms that conjurers use to achieve enchanting phenomena including sensory illusions misdirection of attention and the appearance of mind control and nuanced persuasion most studies to date have focused on either the psychological principles involved in watching and performing magic or neuromagic the neural correlates of such phenomena whereas performers sometimes question the contributions that modern science may offer to the advancement of the magical arts the history of magic reveals that scientific discovery often charts new territories for magicians in this research topic we sketch out the symbiotic relationship between psychological science and the art of magic on the one hand magic can inform psychology with particular benefits for the cognitive social developmental and transcultural components of behavioural science magicians have a large and robust set of effects that most researchers rarely exploit incorporating these effects into existing experimental even clinical paradigms paves the road to innovative trajectories in the study of human behaviour for example magic provides an elegant way to study the behaviour of participants who may believe they had made choices that they actually did not make moreover magic fosters a more ecological approach to experimentation whereby scientists can probe participants in more natural environments compared to the traditional lab based settings examining how magicians consistently influence spectators for example can elucidate important aspects in the study of persuasion trust decision making and even processes spanning authorship and agency magic thus offers a largely underused armamentarium for the behavioural scientist and clinician on the other hand psychological science can advance the art of magic the psychology of deception a relatively understudied field explores the intentional creation of false beliefs and how people often go wrong understanding how to methodically exploit the tenuous twilight zone of human vulnerabilities perceptual logical emotional and temporal becomes all the more revealing when top down influences including expectation symbolic thinking and framing join the fray over

the years science has permitted magicians to concoct increasingly effective routines and to elicit heightened feelings of wonder from audiences furthermore on occasion science leads to the creation of novel effects or the refinement of existing ones based on systematic methods for example by simulating a specific card routine using a series of computer stimuli researchers have decomposed the effect and reconstructed it into a more effective routine other magic effects depend on meaningful psychological knowledge such as which type of information is difficult to retain or what changes capture attention behavioural scientists measure and study these factors by combining analytical findings with performer intuitions psychological science begets effective magic whereas science strives on parsimony and independent replication of results magic thrives on reproducing the same effect with multiple methods to obscure parsimony and minimise detection this research topic explores the seemingly orthogonal approaches of scientists and magicians by highlighting the crosstalk as well as rapprochement between psychological science and the art of deception

this revised and expanded edition of approaches to psychology builds on the wide appeal of the earlier editions it explains what the discipline of psychology is how it developed and how it contributes to the understanding of human behaviour and experience this book introduces students to the five major conceptual frameworks or approaches to psychology biological behaviourist cognitive psychodynamic and humanistic the methods theories and assumptions of each approach are explored so that the reader builds an understanding of psychology as it applies to human development social and abnormal behaviour book jacket

as well as experimental research that considers human consciousness as a derivative of belief in the supernatural thus showing that our feelings emotions attitudes and other psychological processes follow the laws of magic this book synthesises the science of natural phenomena and the magic of the supernatural to present an interesting look at the juxtaposition of the inner and outer selves fusing research into psychological disorders subconscious feelings as well as the rising presence of artificial intelligence this book demonstrates how an engagement with magical thinking can enhance one s creativity and cognitive skills science and magic in the modern world is an invaluable resource for those studying consciousness as well as those looking at the effect of magical thinking on religion politics science and society

a useful manual for any magician or curious spectator who wonders why the tricks seem so real this guide examines the psychological aspects of a magician s work exploring the ways in which human psychology plays into the methods of conjuring rather than focusing on the individual tricks alone this explanation of the general principles of magic includes chapters on the use of misdirection sleight of hand and reconstruction provides a better understanding of this ancient art and offers a section on psychics that warns of their deceptive magic skills

this thought provoking tour through the science of magic will make you question what you know about your brain and your reality a psychologist and magician shows how the scientific study of magic reveals intriguing and often unsettling insights into the mysteries of the human mind what do we see when we watch a magician pull a rabbit out of a hat or read a person s mind we are captivated by an illusion we applaud the fact that we have been fooled why do we enjoy experiencing what seems clearly impossible or at least beyond our powers of

explanation in experiencing the impossible gustav kuhn examines the psychological processes that underpin our experience of magic kuhn a psychologist and a magician reveals the intriguing and often unsettling insights into the human mind that the scientific study of magic provides magic kuhn explains creates a cognitive conflict between what we believe to be true for example a rabbit could not be in that hat and what we experience a rabbit has just come out of that hat drawing on the latest psychological neurological and philosophical research he suggests that misdirection is at the heart of all magic tricks and he offers a scientific theory of misdirection he explores among other topics our propensity for magical thinking the malleability of our perceptual experiences forgetting and misremembering free will and mind control and how magic is applied outside entertainment the use of illusion in human computer interaction politics warfare and elsewhere we may be surprised to learn how little of the world we actually perceive how little we can trust what we see and remember and how little we are in charge of our thoughts and actions exploring magic kuhn illuminates the complex and almost magical mechanisms underlying our daily activities

magical thinking and behavior have traditionally been viewed as immature misleading alternatives to scientific thought that in children inevitably diminish with age in adults these inclinations have been labeled by psychologists largely as superstitions that feed on frustration uncertainty and the unpredictable nature of certain human activities in magic and the mind eugene subbotsky provides an overview of the mechanisms and development of magical thinking and beliefs throughout the life span while arguing that the role of this type of thought in human development should be reconsidered rather than an impediment to scientific reasoning or a byproduct of cognitive development in children magical thinking is an important and necessary complement to these processes enhancing creativity at problem solving and reinforcing coping strategies among other benefits

in adults magical thinking and beliefs perform important functions both for individuals coping with unsolvable problems and stressful situations and for society enabling mass influence and promoting social harmony operating in realms not bound by physical causality such as emotion relationships and suggestion magical thinking is an ongoing developing psychological mechanism that subbotsky argues is integral in the contexts of politics commercial advertising and psychotherapy and undergirds our construction and understanding of meaning in both mental and physical worlds magic and the mind represents a unique contribution to our understanding of the importance of magical thinking offering experimental evidence and conclusions never before collected in one source it will be of interest to students and scholars of developmental psychology as well as sociologists anthropologists and educators
