this assembly of lectures should appeal to anyone with an interest in the history of science and the nature of living things seven of the eight lectures are by eminent biochemists and describe the development of their own subject from the inside the eighth is a more general one

the field of bioinorganic chemistry has grown significantly in recent years now one of the major sub disciplines of inorganic chemistry it has also pervaded other areas of the life sciences due to its highly interdisciplinary nature bioinorganic chemistry inorganic elements in the chemistry of life second edition provides a detailed introduction to the role of inorganic elements in biology taking a systematic element by element approach to the topic the second edition of this classic text has been fully revised and updated to include new structure information emerging developments in the field and an increased focus on medical applications of inorganic compounds new topics have been added including materials aspects of bioinorganic chemistry elemental cycles bioorganometallic chemistry medical imaging and therapeutic advances topics covered include metals at the center of photosynthesis uptake transport and storage of essential elements catalysis through hemoproteins biological functions of molybdenum tungsten vanadium and chromium function and transport of alkaline and alkaline earth metal cations biomineralization biological functions of the non metallic inorganic elements bioinorganic chemistry of toxic metals biochemical behavior of radionuclides and medical imaging using inorganic compounds chemotherapy involving non essential elements this full color text provides a concise and comprehensive review of bioinorganic chemistry for advanced students of chemistry biochemistry biology medicine and environmental science

this volume contains the lectures presented at the second course of the international school of space chemistry held in erice sicily from october 20 30 1991 at the e majorana centre for scientific culture the course was attended by 58 participants from 13 countries the chemistry of life s origins is well recognized as one of the most critical subjects of modern chemistry much progress has been made since the

amazingly perceptive contributions by oparin some 70 years ago when he first outlined a possible series of steps starting from simple molecules to basic building blocks and ultimate assembly into simple organisms capable of replicating catalysis and evolution to higher organisms the pioneering experiments of stanley miller demonstrated already forty years ago how easy it could have been to form the amino acids which are critical to living organisms however we have since learned and are still learning a great deal more about the primitive conditions on earth which has led us to a rethinking of where and how the condition for prebiotic chemical processes occurred we have also learned a great deal more about the molecular basis for life for instance the existence of dna was just discovered forty years ago

the authors of this study on bio inorganic chemistry seek to examine the importance of inorganic elements they survey chemical and physical factors controlling the elements of life discuss the functions of inorganic elements and examine the co operative interaction in living systems

this text describes the functional role of the twenty inorganic elements essential to life in living organisms

as this excellent book demonstrates the study of comets has now reached the fas cinating stage where we understand comets in general simple tenns while at the same time we are uncertain about practically all the details of cometary nature structure processes and origin in every aspect even including dynamics a choice among several or many competing theories is made impossible simply by the lack of detailed knowledge the space missions snapshot studies of two comets partic ularly the one that immortalizes the name of sir edmund halley have produced a huge mass of valuable new infonnation and a number of surprises nonetheless we face the tantalizing realization that we have obtained only a fleeting glance at two of perhaps a hundred billion loll or more comets with possibly differing natures origins and physical histories to my personal satisfaction comets seem to have discrete nuclei made up of dirty snowballs as i concluded four decades ago but perhaps they are more like frozen rubbish piles

biological chemistry also known as biochemistry is the branch of science that explores the chemical processes within and related to living

organisms it is a laboratory based science that combines aspects of biology and chemistry using chemical knowledge and techniques to help understand and solve biological problems this chapter lays the foundation for understanding how chemical principles are essential to life itself at its core biological chemistry examines the building blocks of life atoms and molecules these microscopic components come together to form the macromolecules that make up all living organisms carbon hydrogen oxygen nitrogen phosphorus and sulfur are the key elements involved in biological chemistry forming the backbone of proteins nucleic acids carbohydrates and lipids the way these atoms bond and interact dictates how molecules function and how life processes are carried out molecules do not exist in isolation within the body they interact through a series of chemical reactions that allow for growth energy production reproduction and adaptation these reactions are governed by the laws of thermodynamics and are often facilitated by enzymes specialized proteins that accelerate chemical reactions enzymes are highly specific and work under conditions finely tuned by the cell ensuring that the complex chemistry of life operates smoothly and efficiently

first published in 1966 the chemistry of life has held its own as a clear and authoritative introduction to the world of biochemistry this fourth edition has been fully updated and revised to include the latest developments in dna and protein synthesis cell regulation and their social and medical implications

conventionally evolution has always been described in terms of species the chemistry of evolution takes a novel not to say revolutionary approach and examines the evolution of chemicals and the use and degradation of energy coupled to the environment as the drive behind it the authors address the major changes of life from bacteria to man in a systematic and unavoidable sequence reclassifying organisms as chemotypes written by the authors of the bestseller the biological chemistry of the elements the inorganic chemistry of life oxford university press 1991 the clarity and precision of the chemistry of evolution plainly demonstrate that life is totally interactive with the environment this exciting theory makes this work an essential addition to the academic and public library provides a novel analysis of evolution in chemical

terms stresses systems biology examines the connection between life and the environment starting with the big bang theory reorientates the chemistry of life by emphasising the need to analyse the functions of 20 chemical elements in all organisms

this book is designed for students of biology molecular biology ecology medicine agriculture forestry and other professions where the knowledge of organic chemistry plays the important role the work may also be of interest to non professionals as well as to teachers in high schools the book consists of 11 chapters that cover basic principles of structure and constitution of organic compounds the elements of the nomenclature the concepts of the nature of chemical bond introductions in nmr and ir spectroscopy the concepts and main classes of the organic reaction mechanisms reactions and properties of common classes of organic compounds and the introduction to the chemistry of the natural organic products followed by basic principles of the reactions in living cells
