this monograph describes the background conduct and outcome of part of a long term project of research into the fundamental processes of psychodynamics it was first theorized and then shown empirically that such research can lead to the formulation of certain general laws and lawful patterns in psychodynamics stated at higher levels of conceptualization these formulations enable us to explain systemati cally the diverse configurations effects and intricacies of dynamic systems in psycho logical functioning at the same time the research reported here was intended to contribute to ongoing efforts to secure a proper base for the study and management of intrapsychic or inner functional factors in health and illness this research project has called for concerted inquiry into psychodynamics along a number of dimensions theoretical empirical methodological clinical analytic qualitative quantitative and statistical the clinical programs required intensive inves tigation such as in depth psychodiagnostic examination or psychotherapeutic treat ment of individual patients as well as of nonpatient volunteers the former were drawn from a large number of patients seen in various settings over several years whereas the latter were selected from a group of university student volunteers

reports the results of an analysis of combined mortality data on 95 673 nuclear industry workers at seven facilities in the usa uk and canada workers at these facilities which include both atomic energy stations and nuclear weapons plants have been monitored in previous studies to determine the health effects of external exposure to ionizing radiation by combining and assessing data from previous studies the present analysis aimed to develop more precise estimates of the risk of radiation induced cancer and thus to strengthen the scientific basis for setting radiation protection standards the study also compared risk estimates among workers with estimates obtained in high dose studies including investigations of atomic bomb survivors and of patients irradiated for therapeutic purposes the results represent the most comprehensive and precise direct assessment to date of the carcinogenic risk of protracted external exposure to generally low doses of ionizing radiation the combined analysis of data on nuclear industry workers found a significant increase in the risk of leukemia and of myeloid leukemia in particular at relatively low dose levels

the study also provided an opportunity to examine some of the previously reported associations between low doses of ionizing radiation and mortality from specific cancer types of the 36 cancer types or groupings considered most showed little or no association with radiation exposure apart from leukemia multiple myeloma was the only cancer to exhibit a statistically significant association with radiation dose
