students preparing for courses in real analysis often encounter either very exacting theoretical treatments or books without enough rigor to stimulate an in depth understanding of the subject further complicating this the field has not changed much over the past 150 years prompting few

authors to address the lackluster or overly complex dichotomy existing among the available texts the enormously popular first edition of real analysis and foundations gave students the appropriate combination of authority rigor and readability that made the topic accessible while retaining the strict discourse necessary to advance their understanding the second edition maintains this feature while further integrating new concepts built on fourier analysis and ideas about wavelets to indicate their application to the theory of signal processing the author also introduces relevance to the material and surpasses a purely theoretical treatment by emphasizing the applications of real analysis to concrete engineering problems in higher dimensions expanded and updated this text continues to build upon the foundations of real analysis to present novel applications to ordinary and partial differential equations elliptic boundary value problems on the disc and multivariable analysis these qualities along with more figures streamlined proofs and revamped exercises make this an even more lively and vital text than the popular first edition

requiring no prior knowledge of correspondence analysis this text provides anontechnical introduction to multiple correspondence analysis mca as a method in its own right the authors brigitte le roux and henry rouanet present the material in a practical manner keeping the needs of researchers foremost in mind this supplementary text isappropriate for any graduate level intermediate or advanced statistics course across the social and behavioral sciences as well as forindividual researchers book jacket

introducing time series methods and their application in social science research this practical guide to time series models is the first in the field written for a non econometrics audience giving readers the tools they need to apply models to their own research introduction to time series analysis by mark pickup demonstrates the use of and the assumptions underlying common models of time series data including finite distributed lag autoregressive distributed lag moving average differenced data and garch arma arima and error correction models this volume does an excellent job of introducing modern time series analysis to social scientists who are already familiar with basic statistics and the general linear model william g jacoby michigan state university

spline variables and their interactions play a crucial role in the field of social science this book offers a comprehensive and detailed exploration of this method providing valuable insights and information for researchers in the field man kit lei the university of georgia this volume addresses the issue of linear constraints in regression modeling author roger a wojtkiewicz

uses the method of knotted spline variables also known as piecewise linear regression and a new method involving group spline variables to model nonlinearity in a variety of situations using spline variables to model nonlinearity allows researchers to specify unrestricted models for models that involve interval variables allowing for greater flexibility in modeling any possible interaction

a specialized presentation of fractal analysis oriented to the social sciences this primer uses straightforward language to give the reader step by step instructions for identifying and analyzing fractal patterns and the social process that create them by making fractals accessible to the social science students this book has a significant impact on the understanding of human behavior this is the only book designed to introduce fractal analysis to a general social science audience

social scientists are interested in events and their causes although event histories are ideal for studying the causes of events they typically possess two features censoring and time varying explanatory variables that create major problems for standard statistical procedures several innovative approaches have been developed to accommodate these two peculiarities of event history data this volume surveys these methods concentrating on the approaches that are most useful to the social sciences in particular paul d allison focuses on regression methods in which the occurrence of events is dependent on one or more explanatory variables he gives attention to the statistical models that form the basis of event history analysis and also to practical concerns such as data management cost and useful computer software the second edition is part of sage s quantitative applications in the social sciences qass series which continues to serve countless students instructors and researchers in learning the most cutting edge quantitative techniques
