European NATO members face the dual challenge of Russia's military threat and the United States expectations about significantly greater burden sharing or even burden shifting for Europe's defence. Their commitment at the Hague Summit in June 2025 to invest 5% of GDP in defence expenditure annually by 2035 acknowledged the need to develop a more sovereign European defence capability and reduce critical dependencies. This IISS Strategic Dossier assesses the progress that has been made in building up NATO European defence capability. It analyses the critical hardware gaps of most European NATO allies relating to intelligence surveillance and reconnaissance assets, long range strike systems and integrated air and missile defence. The dossier examines European gaps in the software essential for modern military operations. Although the significant dependence on US providers of hyperscale cloud computing capacity is unlikely to change soon, efforts by European armed forces to address their software gaps have led to European companies developing significant expertise in edge cloud computing for advanced defence projects. The volume discusses how European countries are looking to speed up procurement including through legislative changes. Importantly, the trend towards prioritising equipment purchases from domestic or European suppliers continues. The dossier also assesses the prospects for European allies achieving NATO's new investment pledge. This IISS Strategic Dossier was produced in the context of the IISS Prague Defence Summit PDS 2025 which has been supported by the government of the Czech Republic.

The book focuses on the role of the Leonardo da Vinci projects and inventions, specifically the interdisciplinarity of his studies that

represents perhaps the first example of the paradigm of complex systems engineering the projects are characterized within a modern conception of his thinking looking at the main motivations behind his machines the book also proposes a set of experimental realizations of the models made mainly in wood using the actual concept of automatic control and microcontroller technology emphasizing that the leonardo machines can be seen in agreement with modern current technology the remote control of each machine is considered and the behavior of each monitored machines are revisited based on the transmission principle that adopts microcontrollers and bluetooth devices studying the equipment behind the actuation of the systems thus the paradigm of each machine is maintained unaltered while the latest technologies show the relevance of such inventions in the modern era the study also stimulated more applications and future projects that can start from the original leonardo projects and then proceed to the next centuries providing readers simple and efficient ideas to innovate his projects using modern low cost microcontrollers
