in modeling turbulent reactive flows probability density function pdf methods have an advantage over the more traditional moment closure schemes in that the pdf formulation treats the chemical reaction source terms exactly while moment closure methods are required to model the mean reaction rate the common model used is the laminar chemistry approximation where the effects of turbulence on the reaction are assumed negligible for flows with low turbulence levels and fast chemistry the difference between the two methods can be expected to be small however for flows with finite rate chemistry and high turbulence levels significant errors can be expected in the moment closure method in this paper the ability of the pdf method and the moment closure scheme to accurately model a turbulent reacting flow is tested
