a number of algorithms exist to solve or provide a near optimal solution to the multidimensional assignment problem despite the fact that the multidimensional assignment problem has existed for almost fifty years quickly finding a good quality near optimal solution to the multidimensional assignment problem is still difficult solving large multidimensional assignment problems is difficult due to the total number of feasible solutions to be evaluated the total number of feasible solutions for a $5 \times 5 \times 5 \times 5 \times 5$ multidimensional assignment problem is 207 360 000 the number of feasible solutions grows exponentially as the number of dimensions increases solving smaller multidimensional assignment problems by complete enumeration of all feasible solutions is possible but for larger multidimensional assignment problems with size and dimension equal to or greater than six the time required for complete enumeration often exceeds the time available to compute a solution consequently many multidimensional assignment problem heuristic and metaheuristic algorithms have been developed in order to determine a good quality solution to the multidimensional assignment problem in a minimum or reasonable amount of time some of these algorithms utilize a neighborhood search in order to improve the quality of the starting solution searching a large neighborhood is desirable because a better solution is more likely from searching a larger neighborhood but searching a large neighborhood also requires additional time an improvement graph has been used to solve partitioning problems but has not been utilized to solve a multidimensional assignment problem this work offers a new methodology to solve the multidimensional assignment problem that uses an improvement graph by creating disjoint subsets of the multidimensional assignment problem data using interpermutation exchanges and an improvement graph and creating cyclic transfers it is possible to quickly find a near optimal solution to a multidimensional assignment problem

a technique is presented which finds a fast suboptimal solution to the assignment problem this same technique is then applied to two large dynamic programming problems for which the optimal solution is not known these examples illustrate how easily this technique can be applied and that it is better than most optimizing techniques because it is fast cheap and only minor hand calculations are needed the effect of different initial solutions and their value are compared and it is found that the initial solution is not as significant in a suboptimal technique as in an optimizing technique the initial solution is significant enough however to warrant some care in choosing it abstract leaf ii

solving problems in parallel and distributed computing through the use of bioinspired techniques recent years have seen a surge of interest in computational methods patterned after natural phenomena with biologically inspired techniques such as fuzzy logic neural networks simulated annealing genetic algorithms or evolutionary computer models increasingly being

harnessed for problem solving in parallel and distributed computing solutions to parallel and distributed computing problems presents a comprehensive review of the state of the art in the field providing researchers and practitioners with critical information on the use of bio inspired techniques for improving software and hardware design in high performance computing through contributions from top leaders in the field this important book brings together current research results exploring some of the most intriguing and cutting edge topics from the world of biocomputing including parallel and distributed computing of cellular automata and evolutionary algorithms how the speedup of bio inspired algorithms will help their applicability in a wide range of problems solving problems in parallel simulation through such techniques as simulated annealing algorithms and genetic algorithms techniques for solving scheduling and load balancing problems in parallel and distributed computers applying neural networks for problem solving in wireless communication systems

this introduction to the often mathematically rigorous techniques and applications of management science is designed to make the subject accessible for students with no mathematical background or skills it focuses on management science not only as a collection of techniques and processes but as a philosophy and method for approaching problems in a logical manner as skill that is applicable across disciplines and endeavours in all types of jobs and organizations the author s perspective is contemporary his approach hands on and his pedagogy abundant supportive and user friendly for students and instructors alike
