foundations of statistics for data scientists with r and python is designed as a textbook for a one or two term introduction to mathematical statistics for students training to become data scientists it is an in depth presentation of the topics in statistical science with which any data scientist should be familiar including probability distributions descriptive and inferential statistical methods and linear modeling the book assumes knowledge of basic calculus so the presentation can focus on why it works as well as how to do it compared to traditional mathematical statistics textbooks however the book has less emphasis on probability theory and

more emphasis on using software to implement statistical methods and to conduct simulations to illustrate key concepts all statistical analyses in the book use r software with an appendix showing the same analyses with python key features shows the elements of statistical science that are important for students who plan to become data scientists includes bayesian and regularized fitting of models e g showing an example using the lasso classification and clustering and implementing methods with modern software r and python contains nearly 500 exercises the book also introduces modern topics that do not normally appear in mathematical statistics texts but are highly relevant for data scientists such as bayesian inference generalized linear models for non normal responses e g logistic regression and poisson loglinear models and regularized model fitting the nearly 500 exercises are grouped into data analysis and applications and methods and concepts appendices introduce r and python and contain solutions for odd numbered exercises the book s website stat4ds.rwth-aachen.de has expanded r python and matlab appendices and all data sets from the examples and exercises

a valuable overview of the most important ideas and results in statistical modeling written by a highly experienced author foundations of linear and generalized linear models is a clear and comprehensive guide to the key concepts and results of linear statistical models the book presents a broad in depth overview of the most commonly used statistical models by discussing the theory underlying the models r software applications and examples with crafted models to elucidate key ideas and promote practical model building the book begins by illustrating the fundamentals of linear models such as how the model fitting projects the data onto a model vector subspace and how orthogonal decompositions of the data yield information about the effects of explanatory variables subsequently the book covers the most popular generalized linear models which include binomial and multinomial logistic regression for categorical data and poisson and negative binomial loglinear models for count data focusing on the theoretical underpinnings of these models foundations of linear and generalized linear models also features an introduction to quasi likelihood methods that require weaker distributional assumptions such as generalized estimating equation methods an overview of linear mixed models and generalized linear mixed models with random effects for clustered correlated data bayesian modeling and extensions to handle problematic cases such as high dimensional problems numerous examples that use r software for all text data analyses more than 400 exercises for readers to practice and extend the

theory methods and data analysis a supplementary website with datasets for the examples and exercises an invaluable textbook for upper undergraduate and graduate level students in statistics and biostatistics courses foundations of linear and generalized linear models is also an excellent reference for practicing statisticians and biostatisticians as well as anyone who is interested in learning about the most important statistical models for analyzing data

for courses in statistical methods for the social sciences statistical methods applied to social sciences made accessible to all through an emphasis on concepts statistical methods for the social sciences introduces statistical methods to students majoring in social science disciplines with an emphasis on concepts and applications this book assumes you have no previous knowledge of statistics and only a minimal mathematical background it contains sufficient material for a two semester course the 5th edition gives you examples and exercises with a variety of real data it includes more illustrations of statistical software for computations and takes advantage of the outstanding applets to explain key concepts such as sampling distributions and conducting basic data analyses it continues to downplay mathematics often a stumbling block for students while avoiding reliance on an overly simplistic recipe based approach to statistics
