among many great inventions made in the 20th century electronic circuits which later evolved into integrated circuits are probably the biggest when considering their contribution to human society entering the 21st century the importance of integrated circuits has increased even more in fact without the help of integrated circuits recent high technology society with the internet cellular phone car navigation digital camera and robot would never

have been realized nowadays integrated circuits are indispensable for almost every activity of our society one of the critical issues for the fabrication of integrated circuits has been the precise design of the high speed or high frequency operation of circuits with huge number of components it is quite natural to predict the circuit operation by computer calculation and there have been three waves for this at 15 year intervals the first wave came at the beginning of the 1970s when large scale integrated circuits with more than 1000 components had just been introduced into the market a mainframe computer was used for the simulation and each semiconductor company used its own proprietary simulators and device models however the capability of the computer and accuracy of the model were far from satisfactory and there are many cases of the necessity of circuit redesign after evaluation of the first chip the second wave hit us in the middle of 1980s when the engineering workstation was introduced for use by designers
