providing the quantum mechanical foundations of chemical bonding this unique textbook emphasizes key concepts such as superposition degeneracy of states and the role of the electron spin these quantum mechanical notions are usually oversimplified or meticulously circumvented in other books to the frustration of serious readers who want to understand for example why two protons can be stably bound with only one electron to make the simplest molecule h<sub>2</sub> an initial concise and compact presentation of the rudiments of quantum mechanics enables readers to progress through the book with a firm grounding experimental examples are included to illustrate how the abstract concepts are manifest in real systems

molecular surface science has made enormous progress in the past 30 years the development can be characterized by a revolution in fundamental knowledge obtained from simple model systems and by an explosion in the number of experimental techniques the last 10 years has seen an equally rapid development of quantum mechanical modeling of surface processes using density functional theory dft chemical bonding at surfaces and interfaces focuses on phenomena and concepts rather than on experimental or theoretical techniques the aim is to provide the common basis for describing the interaction of atoms and molecules with surfaces and this to be used very broadly in science and technology the book begins with an overview of structural information on surface adsorbates and discusses the structure of a number of important chemisorption systems chapter 2 describes in detail the chemical bond between atoms or molecules and a metal surface in

the observed surface structures a detailed description of experimental information on the dynamics of bond formation and bond breaking at surfaces make up chapter 3 followed by an in depth analysis of aspects of heterogeneous catalysis based on the d band model in chapter 5 adsorption and chemistry on the enormously important si and ge semiconductor surfaces are covered in the remaining two chapters the book moves on from solid gas interfaces and looks at solid liquid interface processes in the final chapter an overview is given of the environmentally important chemical processes occurring on mineral and oxide surfaces in contact with water and electrolytes gives examples of how modern theoretical dft techniques can be used to design heterogeneous catalysts this book suits the rapid introduction of methods and concepts from surface science into a broad range of scientific disciplines where the interaction between a solid and the surrounding gas or liquid phase is an essential component shows how insight into chemical bonding at surfaces can be applied to a range of scientific problems in heterogeneous catalysis electrochemistry environmental science and semiconductor processing provides both the fundamental perspective and an overview of chemical bonding in terms of structure electronic structure and dynamics of bond rearrangements at surfaces
