given the increasing interest in the near term deployment of new nuclear power plants iaea member states have requested guidance on the process of evaluating and selecting available technology options reactor technology assessment enables the evaluation selection and

deployment of the best technology to meet the objectives of a nuclear power programme this publication demonstrates how reactor technology assessment is performed and how the process and results of this work enable decision making in nuclear power planning the approach also provides decision makers with the documentation necessary to support their conclusions

chemical reactor engineering as a discipline has a central role to play in helping with the development of adequate strategies and technologies that can deal effectively with the concerns of today's society which are increasingly becoming attuned to the environment the current challenge is how to adapt present processes and products to meet more rigorous environmental standards chemical reactor technology for environmentally safe reactors and products addresses these issues in three parts i fuels of the future and changing fuel needs ii alternative sources iii emission control chemical reactor safety and engineering attention is also paid throughout the text to the fundamental technological aspects of reactor engineering and to possible strategies for bridging knowledge gaps

the use of advanced fuels permits the use of coolants organic high pressure helium that result in power conversion systems with good thermal efficiency and relatively low cost water coolant would significantly reduce thermal efficiency while lithium and salt coolants which have been proposed for dt reactors will have comparable power conversion efficiencies but will probably be significantly more expensive helium cooled blankets with direct gas turbine power conversion cycles can also be used with dt reactors but activation problems will be more severe and the portion of blanket power in the metallic structure will probably not be available for the direct cycle because of temperature limitations a very important potential advantage of advanced fuel reactors over dt fusion reactors is the possibility of easier blanket maintenance and reduced down time for replacement if unexpected leaks occur in most cases the leaking circuit can be shut off and a redundant cooling circuit will take over the thermal load with the d he3 reactor it appears practical to do this while the reactor is operating as long as the leak is small enough not to shut down the reactor redundancy for cat d reactors has not been explored in detail but appears feasible in principle the idea of mobile units operating in the reactor chamber for service and maintenance of radioactive elements is explored
