modeling of chemical reactions covers detailed chemical kinetics models for chemical reactions including a comprehensive treatment of pressure dependent reactions which are frequently not incorporated into detailed chemical kinetic models and the use of modern computational quantum chemistry which has recently become an extraordinarily useful component of the reaction kinetics toolkit it is intended both for those who need to model complex chemical reaction processes but have little background in the area and those who are already have experience and would benefit from having a wide range of useful material gathered in one volume the range of

subject matter is wider than that found in many previous treatments of this subject the technical level of the material is also quite wide so that non experts can gain a grasp of fundamentals and experts also can find the book useful a solid introduction to kinetics material on computational quantum chemistry an important new area for kinetics contains a chapter on construction of mechanisms an approach only found in this book

this text presents a balanced presentation of the macroscopic view of empirical kinetics and the microscopic molecular viewpoint of chemical dynamics this second edition includes the latest information as well as new topics such as heterogeneous reactions in atmospheric chemistry reactant product imaging and molecular dynamics of H_2

this cutting edge lab manual takes a multiscale approach presenting both micro semi micro and macroscale techniques the manual is easy to navigate with all relevant techniques found as they are needed cutting edge subjects such as hplc bioorganic chemistry multistep synthesis and more are presented in a clear and engaging fashion

in food processing thermal operations are the most common and conventional methods for obtaining and treating different products this book covers basics and advances in thermal processing of food these include drying processes evaporation blanching deep fat frying crystallization extraction and ohmic heating in terms of food engineering and process design aspect it further describes theoretical aspects the basics of rate kinetics and their application for the analysis of food quality indices including practical oriented issues related to food technology traditional and new extraction techniques are also covered key features presents engineering focus on thermal food

processing technologies discusses sub classification for recent trends and relevant industry information examples different current research oriented results are included as a key parameter covers advances in drying evaporation blanching crystallization and ohmic heating includes mathematical modeling and numerical simulations food processing advances in thermal technologies is aimed at graduate students and professionals in food engineering food technology and biological systems engineering

flavour is a critical aspect of food production and processing requiring careful design monitoring and testing in order to create an appealing food product this book looks at flavour generation flavour analysis and sensory perception of food flavour and how these techniques can be used in the food industry to create new and improve existing products part one covers established and emerging methods of characterising and analysing taste and aroma compounds part two looks at different factors in the generation of aroma finally part three focuses on sensory analysis of food flavour covers the analysis and characterisation of aromas and taste compounds examines how aromas can be created and predicted reviews how different flavours are perceived

topics covered in this publication include quantitative relationships between molecular structure and chemical activity organic inorganic chemistry biochemical kinetics and reaction mechanisms surface kinetics are also explored

basic concepts of both experimental and theoretical chemical kinetics are concisely explained for those seeking a general knowledge of the subject from this well known text now being totally revised and updated in addition the book is an invaluable starting point for those embarking on research in kinetics and physical chemistry extensive chapter bibliographies point the way toward more detailed

accounts or specialized aspects historical background included in both chapter introductions and biographical sketches of important researches in chemical kinetics

the third edition of a classic text originally by frost and pearson that describes the fundamental principles and established practices that apply to the study and the rates and mechanisms of homogeneous chemical reactions in the gas phase and in solution incorporates new advances made during the past 20 years in the study of individual molecular collisions by molecular beam laser applications to experimental kinetics theoretical treatments of reaction rates and our understanding of the principles that govern rates of reaction in solution presents numerous examples of the deduction of mechanism from experiment including intimate details such as stereochemistry and the dependence of reaction pathway on the exact energy states of reacting particles
