the nato advanced study institute on quantum electrodynamics of strong fields was held at lahnstein on the rhine from 15 26 june 1981 the school was devoted to the advances theoretical and exper imental in the physics of strong fields made during the past decade the topic of the first week was almost exclusively quantum electrodynamics with discussions of symmetry breaking in the ground state of the physics of heavy ion collisions and of precision tests of

perturbative quantum electrodynamics this was followed in the second week by the presentation of a broad range of other areas where strong fields occur reaching from nuclear physics over quantum chromodynamics to gravitation theory and astrophysics we were fortunate to be able to call on a body of lecturers who not only have made considerable personal contributions to these advances but who are also noted for their lecturing skills their dedication for their subject was readily transmitted to the stu dents resulting in a very successful school this enthusiasm is also reflected in their contributions to these proceedings which as i believe will in time become a standard source of reference for future work on the physics of strong fields and will help to spread the benefits of the school to a larger audience than those who were able to attend i regret that the soviet colleagues ya b zeldovich and v s popov were unable to participate

this book contains 157 problems in classical electromagnetism most of them new and original compared to those found in other textbooks each problem is presented with a title in order to highlight its inspiration in different areas of physics or technology so that the book is also a survey of historical discoveries and applications of classical electromagnetism the solutions are complete and include detailed discussions which take into account typical questions and mistakes by the students without unnecessary mathematical complexity the problems and related discussions introduce the student to advanced concepts such as unipolar and homopolar motors magnetic monopoles radiation pressure angular momentum of light bulk and surface plasmons radiation friction as well as to tricky concepts and ostensible ambiguities or paradoxes related to the classical theory of the electromagnetic field with this approach the book is both a teaching tool for undergraduates in physics mathematics and electric engineering and a reference for students wishing to work in optics material science electronics plasma physics

but to admit things not visible to the gross creatures that we are is in my opinion to show a decent humility and not just a lamentable addiction to metaphysics j s bell are there quantum jumps on canadian thanksgiving weekend in the autumn of 1994 a lively conference was held at the university of western ontario under the title conceptual problems of relativistic quantum mechanics most of the eighteen papers in this volume are directly connected with that conference articles by both theoretical physicists and philosophers of science are included and many authors will be recognized immediately for their already substantive work in the foundations of physics a quarter century ago howard stein suggested that relativistic quantum field theory should be the contemporary locus of metaphysical research but there were few takers only fairly recently has that changed with the result that the bulk of the papers here pursue issues that go beyond nonrelativistic quantum mechanics or at least have serious implications for its relativistic generalization nevertheless problems interpreting the nonrelativistic theory remain a persistent thorn in the side of any such endeavor and so some of the papers develop innovative approaches to those issues as well
