this book provides a comprehensive introduction to statistical methods for designing early phase dose finding clinical trials it will serve as a textbook or handbook for graduate students and practitioners in biostatistics and clinical investigators who are involved in designing conducting monitoring and analyzing dose finding trials the book will also provide an overview of advanced topics and discussions in this field for the benefit of researchers in biostatistics and statistical science beginning with backgrounds and fundamental notions on dose finding in early phase clinical trials the book then provides traditional and recent dose finding designs of phase i trials for e g cytotoxic agents in oncology to evaluate toxicity outcome included are rule based and model based designs such as 3 3 designs accelerated titration designs toxicity probability interval designs continual reassessment method and related designs and escalation overdose control designs this book also covers more complex and updated dose finding designs of phase i ii and i ii trials for cytotoxic agents and cytostatic agents focusing on both toxicity and efficacy outcomes such as designs with covariates and drug combinations maximum tolerated dose schedule finding designs and so on

this graduate level text provides a survey of the logic and reasoning underpinning statistical analysis as well as giving a broad brush overview of the various statistical techniques that play a major role in scientific and social investigations arranged in rough historical order the text starts with the ideas of probability that underpin statistical

methods and progresses through the developments of the nineteenth and twentieth centuries to modern concerns and solutions assuming only a basic level of mathematics and with numerous examples and illustrations this text presents a valuable resource not only to the experienced researcher but also to the student by complementing courses in a wide range of substantive areas and enabling the reader to rise above the details in order to see the overall structure of the subject

bayesian and frequentist regression methods provides a modern account of both bayesian and frequentist methods of regression analysis many texts cover one or the other of the approaches but this is the most comprehensive combination of bayesian and frequentist methods that exists in one place the two philosophical approaches to regression methodology are featured here as complementary techniques with theory and data analysis providing supplementary components of the discussion in particular methods are illustrated using a variety of data sets the majority of the data sets are drawn from biostatistics but the techniques are generalizable to a wide range of other disciplines

this book is an introduction to the theory of causal inference in observational studies an observational study draws inferences about the effects caused by treatments or preventable exposures when randomized experimentation is unethical or infeasible an observational study is distinguished from an experiment by the problems that follow from the absence of randomized assignment of individuals to treatments observational studies are common in most fields that study the effects of treatments or policies on people including public health and epidemiology economics and public policy medicine and clinical psychology and criminology and empirical legal studies after part i reviews causal inference in randomized experiments the twelve short chapters in parts ii iii and iv introduce modern topics the propensity score ignorable treatment assignment the principal unobserved covariate algorithms for optimal matching randomized reassignment techniques for appraising the covariate balance achieved by matching covariance adjustment sensitivity analysis design sensitivity ways to design an observational study to be insensitive to larger unmeasured biases the large sample efficiency of a sensitivity analysis quasi experimental devices that provide observable information about unmeasured biases evidence factors and complementary analyses to address unmeasured biases the book is accessible to anyone who has completed an undergraduate course in mathematical statistics the subject is developed with the aid of two simple empirical examples concerning the health benefits or harms caused by consuming alcohol the data for these examples and their reanalyses are freely available in an r package itos associated with introduction to the theory of observational studies

compiling insights from leading scholars across the globe this cutting edge handbook presents an overview of comparative education it crucially distinguishes the field from other subdisciplines of educational studies addressing key areas of debate within both scholarship and professional practice
