this book consists of three major parts the first two parts deal with general mathematical concepts and certain areas of operator theory the third part is devoted to ill posed problems it can be read independently of the first two parts and presents a good example of applying the methods of calculus and functional analysis the first part basic concepts briefly introduces the language of set theory and concepts of abstract linear and multilinear algebra also introduced are the language of topology and fundamental concepts of calculus the limit the differential and the integral a special section is devoted to analysis on manifolds the second part operators describes the most important function spaces and operator classes for both linear and nonlinear operators different kinds of generalized functions and their transformations are considered elements of the theory of linear operators are presented spectral theory is given a special focus the third part ill posed problems is devoted to problems of mathematical physics integral and operator equations evolution equations and problems of integral geometry it also deals with problems of analytic continuation detailed coverage of the subjects and numerous examples and exercises make it possible to use the book as a textbook on some areas of calculus and functional analysis it can also be used as a reference textbook because of the extensive scope and detailed references with comments

mathematics develops both due to demands of other sciences and due to its internal logic the latter fact explains the attention of mathematicians to many problems which are in close connection with basic mathematical notions even if these problems have no direct practical applications it is well known that the space of constant curvature is one of the basic geometry notion 208 which induced the wide field for investigations as a result there were found numerous connections of constant curvature spaces with other branches of mathematics for example with integrable partial differential equations 36 153 189 and with integrable hamiltonian systems 141 geodesic flows on compact surfaces of a constant negative curvature with the genus 2 generate many test examples for ergodic theory see also 3 183 and the bibliography therein the hyperbolic space  $h^r$  is the space of velocities in special relativity see sect 7 4 1 and also arises as space like sections in some models of
