fully updated hydrology principles methods and applications thoroughly revised for the first time in 50 years this industry standard resource features chapter contributions from a who s who of international hydrology experts compiled by a colleague of the late dr chow chow s handbook of applied hydrology second edition covers scientific and engineering fundamentals and presents all new methods processes and technologies complete details are provided for the full range of ecosystems and models advanced chapters look to the future of hydrology including climate change impacts extraterrestrial water social hydrology and water security chow s handbook of applied hydrology second edition covers the fundamentals of hydrology data collection and processing hydrology methods hydrologic processes and modeling sediment and pollutant transport hydrometeorologic and hydrologic extremes systems hydrology hydrology of large river and lake basins applications and design the future of hydrology

concentrates on the often neglected but useful aspects of hydrogeological mapping covers geophysical survey methods and the importance of water chemistry as a tool in tracing the route of subsurface water and goes on to lay a basic foundation in subjects

needed for practice in the field stratigraphy structural geology mineralogy petrography and geochemistry also covers basic disciplines and techniques indispensable for geological mapping e g cartography and surveying geophysics drilling soil science hydrology and botanics written from a uniquely practical standpoint

a mathematical primer on groundwater flow is a primer not a treatise designed to supplement not replace the standard textbooks used in most university level hydrogeology courses primarily directed to undergraduate juniors and seniors with a modest background in physics engineering and applied mathematics the text should also appeal to professionals designing to brush up on the mathematical side of groundwater flow on their own

chalk is the most important source of fresh water in north west europe more than eight million cubic metres of water are pumped daily from the aquifer this work presents an authoritative survey of the origin sedimentology and hydraulic properties of this unique rock and the chemical characteristics of the water it contains the factors influencing the flow through the chalk and its role as a hydrocarbon reservoir in the north sea are reviewed along with the threats that industrial chemicals fertilizers and pesticides present to the supply the long term implications of pollutants in this vital resource and the continuing ignorance of the factors that control the flow of water through the rock are highlighted

traditional means of data gathering are inadequate for present purposes in hydrology and water management thus hydrologists are urgently seeking new ways for supplementing their conventional data supplies satellite remote sensing is being explored increasingly as one possible answer to such data acquisition problems both because of its perceived facility for providing greatly improved space and time coverage of key hydrological observation systems and because the technologies of data acquisition transmission and processing have become more advanced and more capable although the use of remote sensing especially from satellites is currently

less well developed in these contexts than in support of many other earth resource and environmental sciences much successful hydrological research has already been based upon satellite data and in limited but important ways satellite data have already begun to be used in water monitoring and management operations

intended to complement the 1 250 000 scale hydrogeology map of northern ireland this work provides an understanding of the hydrogeology of northern ireland and through this the enhanced production and development of groundwater resources incorporated within it are the results of most of the hydrogeological work undertaken both by the bgs and the gsni in the area including the bgs hydrogeological work undertaken both by the bgs hydrogeological survey carried out for the environmental service of the department of the environment for northern ireland between 1992 and 1994

published by the american geophysical union as part of the geophysical monograph series volume 47 there are a number of reasons for organizing a symposium one is to bring specialists together to discuss a specific problem in which they all have expertise and encourage the participants to talk openly about their current work which in all likelihood is not going to be in publishable form for some time another reason might be that a problem has been identified by one group of experts which needs the input from a previously loosely allied group before real progress can be made the international union of geodesy and geophysics symposium u s hydrogeological regimes and their subsurface thermal effects organised for the august 1987 general assembly in vancouver was a symposium of the latter type
