the cost of operating a building far exceeds the cost of constructing it and yet until recently little attention was paid to the impact of solar radiation on the costs of heating cooling and ventilation and now that there has been a surge in interest in energy efficiency and solar design architects and designers need a practical guide to the modelling and application of solar energy data there are many different models and techniques available for calculating

the distribution of solar radiation on and in buildings and these algorithms vary considerably in scope accuracy and complexity this book demonstrates which of these predictive tools gives the best results in different circumstances including explaining which models can be best used in different parts of the world the author has had over twenty five years of experience of dealing with solar energy data from four continents and has used that experience in this book to show the development not just of knowledge but also the growing sophistication of the models available to apply it

this paper analyzes the performance of heteroskedasticity and autocorrelation consistent hac covariance matrix estimators in which the residuals are prewhitened using a vector autoregressive var filter we highlight the pitfalls of using an arbitrarily fixed lag order for the var filter and we demonstrate the benefits of using a model selection criterion either aic or bic to determine its lag structure furthermore once data dependent var prewhitening has been utilized we find negligible or even counter productive effects of applying standard kernel based methods to the prewhitened residuals that is the performance of the prewhitened kernel estimator is virtually indistinguishable from that of the varhac estimator

we analyze how uncertainty about when information about future returns to a project may be revealed affects investment while good news about future returns boosts investment good news about news that is news that information may arrive sooner is shown to depress investment we show that early revelation increases the value of an irreversible investment project to a risk neutral investor we relate our results on preference for early revelation to results in non expected utility theory our framework allows us to study irreversible investment projects whose value has a time variable volatility we also consider how heterogeneity of revelation information across firms may induce a better informed firm to share its information with competitors

matching estimators for average treatment effects are widely used in evaluation research despite the fact that their large sample properties have not been established in many cases in this article we develop a new framework to analyze the properties of matching estimators and establish a number of new results first we show that matching estimators include a conditional bias term which may not vanish at a rate faster than  $\sqrt{n}$  when more than one continuous variable is used for matching as a result matching estimators may not be  $\sqrt{n}$  consistent second we show that even after removing the conditional bias matching estimators with a fixed number of matches do not reach the semiparametric efficiency bound for average treatment effects although the efficiency loss may be small third we propose a bias correction that removes the conditional bias asymptotically making matching estimators  $\sqrt{n}$  consistent fourth we provide a new estimator for the conditional variance that does not require consistent nonparametric estimation of unknown functions we apply the bias corrected matching estimators to the study of the effects of a labor market program previously analyzed by lalonde 1986 we also carry out a small simulation study based on lalonde's example where a simple implementation of the biascorrected matching estimator performs well compared to both simple matching estimators and to regression estimators in

terms of bias and root mean squared error software for implementing the proposed estimators in stata and matlab is available from the authors on the web

method of simulated moments msm estimators introduced by mcfadden 1989 and pakes and pollard 1989 are of great use to applied economists they are relatively easy to use even for estimating very complicated economic models one simply needs to generate simulated data according to the model and choose parameters that make moments of this simulated data as close as possible to moments of the true data this paper uses importance sampling techniques to address a significant computational caveat regarding these msm estimators that often one s economic model is hard to solve examples include complicated equilibrium models and dynamic programming problems we show that importance sampling can reduce the number of times a particular model needs to be solved in an estimation procedure significantly decreasing computational burden

an important practical objective of empirical studies of treatment response is to provide decision makers with information useful in choosing treatments often the decision maker is a planner who must choose treatments for the members of a heterogeneous population for example a physician may choose medical treatments for a population of patients studies of treatment response cannot provide all the information that planners would like to have as they choose treatments but researchers can be of service by addressing several questions how should studies be designed in order to be most informative how should studies report their findings so as to be most useful in decision making how should planners utilize the information that studies provide this paper addresses aspects of these broad questions focusing on pervasive problems of identification and statistical inference that arise when studying treatment response
