present value of future cash flows based on a discount rate that reflects the risk associated with the company's investments

Comparable company analysis CCA Compares a company's valuation metrics like price-to-earnings ratio PE or EV/EBITDA to similar companies in the industry

Precedent transaction analysis PTA Examines the valuation metrics of similar companies that have recently been acquired or merged to determine a fair price

How do you calculate the cost of equity? The cost of equity represents the return required by investors for holding a company's stock. It can be calculated using the Capital Asset Pricing Model CAPM or the dividend discount model DDM.

$\text{Cost of equity} = \text{Risk-free rate} + \text{Beta} \times \text{Market risk premium}$

DDM Cost of equity = $\frac{\text{Expected dividend}}{\text{Current stock price}} + \text{Growth rate}$

What are the key factors affecting a company's valuation? Growth prospects, Companies with strong growth potential tend to have higher valuations.

Profitability, High profitability indicates a company's ability to generate sustainable earnings.

Risk, Higher risk generally leads to lower valuations.

Market conditions, Overall economic and industry conditions influence valuation.

3 Capital Budgeting

What is the net present value (NPV) method and how is it used? NPV is a commonly used capital budgeting technique that calculates the present value of future cash flows generated by a project minus the initial investment.

Decision rule: If the NPV is positive, the project is considered profitable and should be accepted. If the NPV is negative, the project is not considered profitable and should be rejected.

What are the advantages and disadvantages of using the payback period method? Advantages: Easy to understand and calculate. Disadvantages: Ignores the time value of money and the cash flows generated after the payback period.

How do you calculate the internal rate of return (IRR)? IRR is the discount rate at which the NPV of a project equals zero.

Decision rule: If the IRR is higher than the required rate of return, the project is considered acceptable. If the IRR is lower, the project should be rejected.

What is sensitivity analysis and why is it important in capital budgeting? Sensitivity analysis evaluates the impact of changes in key input variables (e.g., sales, costs, discount rate) on the project's profitability.

Importance: Helps assess the risk associated with a project and identify critical factors that could significantly affect its outcome.
