algebra is widely recognised to be a difficult aspect of the mathematics curriculum one that not all pupils see the point of yet an understanding of algebra provides the key to the great power and potential interest of mathematics in general up to now detailed advice and guidance on the teaching and learning of algebra has been difficult to find here however doug french provides a comprehensive authoritative and above all constructive guide to the subject

the cognitive foundations of geometry have puzzled academics for a long time and even today are mostly unknown to many scholars including mathematical cognition researchers foundations of geometric cognition shows that basic geometric skills are deeply hardwired in the visuospatial cognitive capacities of our brains namely spatial navigation and object recognition these capacities shared with non human animals and appearing in early stages of the human ontogeny cannot however fully explain a uniquely human form of geometric cognition in the book hohol argues that euclidean geometry would not be

possible without the human capacity to create and use abstract concepts demonstrating how language and diagrams provide cognitive scaffolding for abstract geometric thinking within a context of a Euclidean system of thought taking an interdisciplinary approach and drawing on research from diverse fields including psychology cognitive science and mathematics this book is a must read for cognitive psychologists and cognitive scientists of mathematics alongside anyone interested in mathematical education or the philosophical and historical aspects of geometry
