while information technology continues to play a vital role in every aspect of our lives there is a greater need for the security and protection of this information ensuring the trustworthiness and integrity is important in order for data to be used appropriately privacy solutions and security frameworks in information protection explores the areas of concern in guaranteeing the security and privacy of data and related technologies this reference source includes a range of topics in information security and privacy provided for a diverse readership ranging from academic and professional researchers to industry practitioners

in its thousands of years of history mathematics has made an extraordinary career it started from rules for bookkeeping and computation of areas to become the language of science its potential for decision support was fully recognized in the twentieth century only vitally aided by the evolution of computing and communication technology mathematical optimization in particular has developed into a powerful machinery to help planners

whether costs are to be reduced profits to be maximized or scarce resources to be used wisely optimization methods are available to guide decision making optimization is particularly strong if precise models of real phenomena and data of high quality are at hand often yielding reliable automated control and decision procedures but what if the models are soft and not all data are around can mathematics help as well this book addresses such issues e.g. problems of the following type an elevator cannot know all transportation requests in advance in which order should it serve the passengers wing profiles of aircrafts influence the fuel consumption is it possible to continuously adapt the shape of a wing during the flight under rapidly changing conditions robots are designed to accomplish specific tasks as efficiently as possible but what if a robot navigates in an unknown environment energy demand changes quickly and is not easily predictable over time some types of power plants can only react slowly

a concise handbook of mathematics physics and engineering sciences takes a practical approach to the basic notions formulas equations problems theorems methods and laws that most frequently occur in scientific and engineering applications and university education the authors pay special attention to issues that many engineers and students

this textbook covers the fundamentals of optimization including linear mixed integer linear nonlinear and dynamic optimization techniques with a clear engineering focus it carefully describes classical optimization models and algorithms using an engineering problem solving perspective and emphasizes modeling issues using many real world examples related to a variety of application areas providing an appropriate blend of practical applications and optimization theory makes the text useful to both practitioners and students and gives the reader a good sense of the power of optimization and the potential difficulties in applying optimization to modeling real world systems the book is intended for undergraduate and graduate level teaching in industrial engineering and other engineering specialties it is also of use to industry practitioners due to the inclusion of real world applications opening the door to advanced courses on both modeling and algorithm development within the industrial engineering and operations research fields

the critical step in the use of mathematics for solving real world problems is the building of a suitable mathematical model this book advocates a novel approach to the teaching of the building process for mathematical models with emphasis on the art as well as the science aspects using a case study approach the book teaches the mathematical modelling process in a comprehensive framework presenting an overview of the concepts and techniques needed for modelling the book is structured in three parts the first dealing with the science aspect the second dealing with the art aspects and the third combining self learning exercises for the student and supplementary resource material for the instructor

environmental issues is one of the significantly important subjects to be solved on a global scale for attaining sustainable developments in the new century a major feature of environmental issues is that studies on environments are interdisciplinary and should deal with complex and heterogeneous systems which include chemical physical and biological

phenomena and further socio economical activities and technology developments for energy saving and co 2 emission reduction the workshop provided the forum for presentation of new developments in the important interdisciplinary field of environmental systems involving the application of concepts methods and techniques of modeling and control the aim was to review state of the art systems and control approaches exchange new results in interdisciplinary fields and look at feasible developments to the future the scope of this workshop covered various aspects of systems and control approaches to environmental issues environmental assessment systems approaches to environmental management and strategies modeling of global warming and impact analysis on socio structure modeling of ecological systems control and optimization of environmental quantities system reform and integration for environments advanced control technology for reduction of energy consumption and co 2 emission cogeneration systems control systems approaches to clean energy fuel cells and their applications systems integration technologies in urban planning systems modeling and data analysis in life cycle assessment manufacturing in symbiosis with environments modeling and control of waste incineration plant water quality control and waste water management other related topics
