these are my lecture notes from cs681 design and analysis of algorithms a one semester graduate course i taught at cornell for three consecutive fall semesters from 88 to 90 the course serves a dual purpose to cover core material in algorithms for graduate students in computer science preparing for their phd qualifying exams and to introduce theory students to some advanced topics in the design and analysis of algorithms the material is thus a mixture of core and advanced topics at first i meant these notes to supplement and not supplant a textbook but over the three years they gradually took on a life of their own in addition to the notes i depended heavily on the texts a v abo j e hopcroft and j d ullman the design and analysis of computer algorithms addison wesley 1975 m r garey and d s johnson computers and intractability a guide to the theory of np completeness w h freeman 1979 r e tarjan data structures and network algorithms siam regional conference series in applied mathematics 44 1983 and still recommend

them as excellent references

as the speed and power of computers increases so does the need for effective programming and algorithm analysis by approaching these skills in tandem mark allen weiss teaches readers to develop well constructed maximally efficient programs in java a full language update to java 5 0 throughout the text particularly its use of generics adds immeasurable value to this advanced study of data structures and algorithms this second edition features integrated coverage of the java collections library as well as a complete revision of lists stacks queues and trees weiss clearly explains topics from binary heaps to sorting to np completeness and dedicates a full chapter to amortized analysis and advanced data structures and their implementation figures and examples illustrating successive stages of algorithms contribute to weiss careful rigorous and in depth analysis of each type of algorithm a logical organization of topics and full access to source code compliment the text s coverage

a successor to the first edition this updated and revised book is a great companion guide for students and engineers alike specifically software engineers who design reliable code while succinct this edition is mathematically rigorous covering the foundations of both computer scientists and mathematicians with interest in algorithms besides covering the traditional algorithms of computer science such as greedy dynamic programming and divide conquer this edition goes further by exploring two classes of algorithms that are often overlooked randomised and online algorithms with emphasis placed on the algorithm itself the coverage of both fields are timely as the ubiquity of randomised algorithms are expressed through the emergence of cryptography while online algorithms are essential in numerous fields as diverse as operating systems and stock market predictions while being relatively short to ensure the essentiality of content a strong focus has been placed on self containment introducing the idea of pre post conditions and loop invariants to readers of all backgrounds containing programming exercises in python solutions will also be placed on the book s website

until now no other book examined the gap between the theory of algorithms and the production of software programs focusing on practical issues a programmer s companion to algorithm analysis carefully details the transition from the design and analysis of an algorithm to the resulting software program consisting of two main complementary
