in many enterprises the number of deployed applications is constantly increasing those applications often several hundreds form large software landscapes the comprehension of such landscapes is frequently impeded due to for instance architectural erosion personnel turnover or changing requirements furthermore events such as performance anomalies can often only be understood in correlation with the states of the applications therefore an efficient and effective way to comprehend such software landscapes in combination with the details of each application is required in this thesis we introduce a live trace visualization approach to support system and program comprehension in large software landscapes it features two perspectives a landscape level perspective using uml elements and an application level perspective following the 3d software city metaphor our main contributions are 1 an approach named explorviz for enabling live trace visualization of large software landscapes 2 a monitoring and analysis approach capable of logging and processing the huge amount of conducted method calls in large software landscapes and 3 display and interaction concepts for the software city metaphor beyond classical 2d displays and 2d pointing devices extensive lab experiments show that our monitoring and analysis approach elastically scales to large software landscapes while imposing only a low overhead on the productive systems furthermore several controlled experiments demonstrate an increased efficiency and effectiveness for solving comprehension tasks when using our visualization explorviz is available as open source software on explorviz.net additionally we provide extensive experimental packages of our evaluations to facilitate the verifiability and reproducibility of our results

this book provides an overview of the emerging field of in situ visualization i.e. visualizing simulation data as it is generated in situ visualization is a processing paradigm in response to recent trends in the development of high performance computers it has great promise in its ability to access increased temporal resolution and leverage extensive computational power however the paradigm also is widely viewed as limiting when it comes to exploration oriented use cases furthermore it will require visualization systems to become increasingly complex and constrained in usage as research efforts on in situ visualization are growing the state of the art and best practices are rapidly maturing specifically this book contains chapters that reflect state of the art research results and best practices in the area of in situ visualization our target audience are researchers and

practitioners from the areas of mathematics computational science high performance computing and computer science that work on or with in situ techniques or desire to do so in future

this volume covers the main data visualization tools used in the molecular sciences with each tool covered in a separate chapter the tools covered include general purpose tools avs and data explorer and specialized tools autodesk s hyperchem cray s unichem and biosym s insight

doctoral thesis dissertation from the year 2007 in the subject computer science applied grade 1 0 technical university of munich institut für informatik language english abstract in this thesis i present a framework for physical simulation and visualization of deformable volumetric bodies in real time based on the implicit finite element method a multigrid approach for the efficient numerical simulation of elastic materials has been developed due to the optimized implementation of the multigrid scheme 200 000 elements can be simulated at a rate of 10 time steps per second the approach enables realistic and numerically stable simulation of bodies that are described by tetrahedral or hexahedral grids it can efficiently simulate heterogeneous bodies i e bodies that are composed of material with varying stiffness and includes linear as well as non linear material laws to visualize deformable bodies a novel rendering method has been developed on programmable graphics hardware it includes the efficient rendering of surfaces as well as interior volumetric structures both the physical simulation framework and the rendering approach have been integrated into a single simulation support system thereby available communication bandwidths have been efficiently exploited to enable the use of the system in practical applications a novel approach for collision detection has been included this approach allows one to handle geometries that are deformed or even created on the graphical subsystem
