learned and fixed behaviors underlie many of the patterns we observe in songbirds but the environmental context in which these patterns occur is changing quickly often to the detriment of the individual and species the goal of this book is to weave concepts of behavior more tightly into our conservation strategies each chapter describes the current understanding of behavior in relation to a particular songbird life history trait the authors then evaluate challenges that songbirds face in the anthropocene and explore the role of behavior in addressing these challenges the future is uncertain for songbirds but broadening our management toolkit will increase the potential for success

this edited volume reviews our past and present understanding of the ecology of australian freshwater fishes it compares patterns and processes in australia with those on other continents discusses the local relevance of ecological models from the northern hemisphere and considers how best to manage our species and their habitats in the face of current and future threats in view of these challenges the need for redress is urgent the chapters are written by some of our foremost researchers and

managers developing themes that underpin our knowledge of the ecology conservation and management of fish and fish habitats for each theme the authors formulate a synthesis of what is known consider the need for new perspectives and identify gaps and opportunities for research monitoring and management the themes have an australian context but draw upon ideas and principles developed by fish biologists in other parts of the world the science of freshwater fish ecology in australia has grown rapidly from its roots in natural history and taxonomy this book offers an introduction for students researchers and managers one that the authors hope will carry australian fish biology and resource management to new levels of understanding

this book examines the effects of environmental heterogeneity or patchiness on populations of plants and animals the factors explored include variations in space time climactic conditions food and other resources and exposure to predators and parasites in contrast to the once prevailing view that environmental variation can be averaged out without losing essential dynamics the contributors to this volume find such heterogeneities often play a significant role in structuring large populations especially in lessening the risk of extinction topics include the ways animals choose between patches that will expose them to different probabilities of starvation and predation conservation in a variable environment and the optimal size of reserves sex determination and sex ratios patchiness and community structure and extinctions of populations in correlated environments the book will be of interest to ecologists entomologists environmental scientists population geneticists and biologists specializing in evolution population or conservation
