the main goal of this project was to investigate and compare the performance of an r410a air conditioner to that of an r22 air conditioner with specific interest in performance at high ambient temperatures at which the condenser of the r410a system may be operating above the refrigerant's critical point part 1 of this project consisted of conducting comprehensive measurements of thermophysical for refrigerant r125 and refrigerant blends r410a and r507a and developing new equation of state formulations and mixture models for predicting thermophysical properties of hfc refrigerant blends part 2 of this project conducted performance measurements of split system 3 ton r22 and r410a residential air conditioners in the 80 to 135 f 27.8 to 57.2 c outdoor temperature range and development of a system performance model the performance data was used in preparing a beta version of evap cond a windows based simulation package for predicting performance of finned tube evaporators and condensers the modeling portion of this project also included the formulation of a model for an air conditioner equipped with a thermal expansion valve txv capacity and energy efficiency ratio eer were measured and compared the r22 system's performance was measured over the outdoor ambient temperature range of 80 to 135 f 27.8 to 57.2 c the same test range was planned for the r410a system however the compressor's safety system cut off the compressor at the 135.0 f 57.2 c test temperature the highest measurement on this system was at 130.0 f 54.4 c subsequently a custom manufactured r410a compressor with a disabled safety system and a more powerful motor was installed and performance was measured at outdoor temperatures up to 155.0 f 68.3 c both systems had similar capacity and eer performance at 82.0 f 27.8 c the capacity and eer degradation of both systems were nearly linearly dependent with rising ambient outdoor ambient test temperatures the performance degradation of r410a at higher temperatures was greater than r22 however the r22 and r410a systems both operated normally during all tests visual observations of the r410a system provided no indication of vibrations or txv hunting at high ambient outdoor test conditions with the compressor operating in the transcritical regime
