when gasoline prices rise people notice the news is filled with reports of pinched household budgets and politicians feeling pressure to do something to ameliorate the burden yet raising the gasoline tax to internalize externalities is widely considered by economists to be among the most economic efficiency improving policies we could implement in the transportation sector this dissertation brings new evidence to bear on quantifying the responsiveness to changing gasoline prices both on the intensive margin i e how much to drive and the extensive margin i e what vehicles to buy i assemble a unique and extremely rich vehicle level dataset that includes all new vehicle registrations in california 2001 to 2009 and all of the mandatory smog check program odometer readings for 2002 to 2009 the full dataset exceeds 49 million observations using this dataset i quantify the responsiveness to gasoline price changes on both margins as well as the heterogeneity in the responsiveness i develop a novel structural model of vehicle choice and subsequent utilization where consumer decisions are modeled in a dynamic setting that explicitly accounts for selection on unobserved driving preference at both the time of purchase and the time of driving this utility consistent model allows for the analysis of the welfare implications to consumers and government of a variety of different policies including gasoline taxes and feebates i find that consumers are responsive to changing gasoline prices in both vehicle choice and driving decisions with more responsiveness than in many recent studies in the literature i estimate a medium run i e roughly two year elasticity of fuel economy with respect to the price of gasoline for new vehicles around 0.1 for california a response that varies by whether the vehicle manufacturer faces a tightly binding fuel economy standard i estimate a medium run elasticity of driving with respect to the price of

gasoline around 0.15 for new personal vehicles in the first six years older vehicles are driven much less but tend to be more responsive with an elasticity of roughly 0.3. I find that the vehicle level responsiveness in driving to gasoline price changes varies by vehicle class, income, geographic and demographic groups. I also find that not including controls for economic conditions and not accounting for selection into different types of new vehicles based on unobserved driving preference tend to bias the elasticity of driving away from zero, implying a greater responsiveness than the true responsiveness. This is an important methodological point for much of the literature estimating similar elasticities ignores these two issues. These results have significant policy implications for policies to reduce gasoline consumption and greenhouse gas emissions from transportation. The relatively inelastic estimated responsiveness on both margins suggests that a gasoline tax policy may not lead to dramatic reductions in carbon dioxide emissions but is a relatively non-distortionary policy instrument to raise revenue when the externalities of driving are considered. An increased gasoline tax may not only be relatively non-distortionary but even economically efficiency improving. However, I find that the welfare changes from an increased gasoline tax vary significantly across counties in California, an important consideration for the political feasibility of the policy. Finally, I find suggestive evidence that the rebound effect of a policy that works only on the extensive margin such as a feebate or CAFE standards may be closer to zero than the elasticity of driving with respect to the price of gasoline. This suggestive finding is particularly important for the analysis of the welfare effects of any policy that focuses entirely on the extensive margin.

The ability to bring new and innovative products to market rapidly is the prime critical competence for any successful consumer-driven company. All industries, especially automotive, are slashing product development lead times. In the current hyper-competitive marketplace, this book is the first to thoroughly examine and analyze the truly effective product development methodology that has made Toyota the most forward-thinking company in the automotive industry, winner of the 2007 Shingo Prize for excellence in manufacturing research. In the Toyota product development system, integrating people, process, and technology, James Morgan and Jeffrey Liker compare and contrast the world-class product development process of Toyota with that of a U.S. competitor. They use extensive examples from Toyota and the U.S. competitor to demonstrate value stream mapping as an extraordinarily powerful tool for continuous improvement through examples and case studies. This book illustrates specific techniques and proven practices for dealing with challenges associated with product development, such as synchronizing multiple disciplines, multiple function workload leveling, compound process variation, effective technology integration, and knowledge management. Readers of this book can focus on optimizing the entire product development value stream rather than focus on a specific tool or technology for local improvements.

Features include MSRP and dealer invoice prices, specifications, and reviews. Standard and optional equipment and buying and leasing advice. Readers get access to toll-free car buying service.
