new finite elements are needed as well in research as in industry environments for the development of virtual prediction techniques the design and implementation of novel finite elements for specific purposes is a tedious and time consuming task especially for nonlinear formulations the automation of this process can help to speed up this process considerably since the generation of the final computer code can be accelerated by order of several magnitudes this book provides the reader with the required knowledge needed to employ modern automatic tools like acegen within solid mechanics in a successful way it covers the range from the theoretical background algorithmic treatments to many different applications the book is written for advanced students in the engineering field and for researchers in educational and industrial environments

this book presents a theoretical treatment of nonlinear behaviour of solids and structures in such a way that it is suitable for numerical computation typically using the finite element method starting out from elementary concepts the author systematically uses the principle of virtual work initially illustrated by truss structures to give a self contained and rigorous account of the basic methods the author illustrates the combination of translations and rotations by finite deformation beam theories in absolute and co rotation format and describes the deformation of a three dimensional continuum in material form a concise introduction to finite elasticity is followed by an extension to elasto plastic materials via internal variables and the maximum dissipation principle finally the author presents numerical techniques for solution of the nonlinear global equations and summarises recent results on momentum and energy conserving integration of time dependent problems exercises examples and algorithms are included throughout
