reducing transport sector emissions is an important pillar of the green transition however
the transition to electric vehicles ev portends major changes in vehicle manufacturing
activity on which many livelihoods in europe depend using the heterogeneity across
european countries in the speed of transition to ev production and variation in sectoral and
regional exposure to the automotive sector this paper offers early evidence of the labor
market implications of the ev transition our results suggest that the transformation of the
auto sector is already having an adverse impact on employment in the affected sectors and
regions which can be expected to grow at least in the near term many of the affected

workers will be able to retire and our analysis suggests that those who will have to transition to new greener jobs have a fair chance to do so when compared to other workers in the manufacturing sector furthermore we find evidence that active labor market policies specifically training can help to reduce the adjustment costs for the affected workers
