Explorations in developmental biology is a revolutionary departure from time honored introductory texts the book is based on the premise that the substance concepts and excitement of contemporary developmental biology are best communicated to students by using the same form in which they were first communicated to the scientific community original research reports but a simple collection of original papers is not sufficient it is too limited in scope and too disjointed and students are not prepared to read them with understanding in this book designed to serve as the principal text for a first or second course in developmental biology basic concepts are presented in a series of 22 chapters that focus on major often unsolved problems ranging from self assembly to embryonic induction to cellular communication by surface contact within each chapter the authors provide the necessary background in developmental biology and also describe the specific experimental procedures that enable the student to understand and appreciate the contributions of significant research papers that are included the authors texts and the reprinted papers are integrated into a cohesive whole so that each chapter provides up to date information about an important area of developmental biology and raises specific questions throughout the text is profusely illustrated with original drawings and with figures taken from the literature and each chapter contains a brief guide to pertinent publications explorations in developmental biology makes it possible for teachers and students to penetrate the perennial barrier between classroom and research laboratory students who use this book are well equipped to move on to more advanced studies in biology for they will have acquired the ability to use and to evaluate original scientific communications and will have assimilated the subject matter of a science that is at the center of modern biology

lifetime assays for carcinogenicity in experimental animals together with data on genetic and related effects on a variety of organisms have long been the foundation for predictions of

carcinogenic hazard to human beings recent scientific advances have provided new assays and novel test systems that are beginning to supplement and in the future may even replace the well established tests that have been widely used for the last four decades this publication reviews the evidence that justifies the use of lesions that precede histologically defined malignancy as endpoints to predict carcinogenicity it evaluates the utility of non mammalian species and of genetically engineered rodents as subjects for carcinogenicity tests and mutations in cancer related genes in human and experimental animal tumours as footprints of environmental carcinogens it evaluates the use of established and novel assays for genetic toxicity in the prediction of carcinogenicity finally it formulates recommendations on the use of such data in the process of evaluation of carcinogenic hazards by the iarc monographs on the evaluation of carcinogenic risks to humans

predictive drug testing on human tumor cells in order to define the appropriate chemotherapy will remain imperative as long as the anticancer agents available are few in number and show only limited activity the advantages of an effective test would lie in obviating the need for testing antineoplastic agents on large cohorts of patients for assessment of drug activity phase ii studies and in allowing determination of optimal use of anticancer agents phase iii trials such an in vitro test could help to better define dose and schedule of drugs preclinically the additive value of individual drugs could be determined on tumor cells in vitro in order to define the best combination chemotherapy in vivo test directed therapy would avoid unnecessary drug related morbidity in patients with refractory tumors chemotherapy treatment would be more than justified even with side effects if palliation or even prolonged survival could be anticipated as a result the benefits of predictive drug testing on human tumor cells would extend beyond improvement of individual patient treatment if the testing helped to identify new active agents this spectrum of benefits to the entire field of oncology provides tremendous motivation for the development of such testing although a number of chemosensitivity tests have been proposed since the advent of modern anticancer chemotherapy interest has been renewed by the possibility of cloning human tumor cells on agar plates with a view to testing drug activity on cells with high proliferation capacity
