this innovative new text from jeffrey sachs and xiokai yang introduces students to development economics from the perspectives of inframarginal analysis and marginal analysis the book demonstrates how the new found emphasis on inframarginal analysis has influenced a shift back to an interest in classical economics from neoclassical economics. Inframarginal analysis vs marginal analysis is presented as a consistent theoretical framework throughout. It shows how the relationship of inframarginal analysis to marginal analysis has influenced the shift back to an interest in classical economics from neoclassical economics. With regard to economic development, it allows economists to reduce their overall reliance on marginal analysis, which may be less relevant to development economics than it is to the economics of development countries. This brings considerable analytic machinery to bear on important problems. A focus on institutions and transaction costs that is very relevant to development economics offers a thorough analysis of trade (chs 3-7) and macroeconomics (chs 16-19) both of which are not dealt with in depth by comparable textbooks.

the empirical evidence reveals conditional convergence in the sense that economies grow faster per capita if they start further below their steady state positions for a homogeneous group of economies like the u s states regions of western european countries and the gcd countries the convergence is unconditional in that the poor economies grow faster than the rich ones the neoclassical growth model for a closed economy fits these facts if capital is viewed broadly to encompass human investments so that diminishing returns to capital set in slowly and if differences in government policies or preferences about saving lead to heterogeneity in steady state positions yet if the model is opened to allow for full capital mobility then the predicted rates of convergence for capital and output are much higher than those observed empirically we show that the open economy model conforms with the evidence if an economy can use foreign debt to finance only a portion of its capital even if 50 or more of the total the problems in using human capital as

collateral can explain the required imperfection in the credit market

a key economic issue is whether poor countries or regions tend to grow faster than rich ones are there automatic forces that lead to convergence over time in levels of per capita income and product after considering predictions of closed and open economy neoclassical growth theories we examine data since 1840 from the u s states we find clear evidence of convergence but the findings can be reconciled quantitatively with neoclassical models only if diminishing returns to capital set in very slowly the results from a broad sample of countries are similar if we hold constant a set of variables that proxy for differences in steady state characteristics two types of existing theories seem to fit the facts the neoclassical growth model with broadly defined capital and a limited role for diminishing returns and endogenous growth models with constant returns and gradual diffusion of technology across economies

the various studies in this book constitute a useful resource of the current level of knowledge on the pattern of and trends in regional disparities in the european union what they tend to show is that there remains enormous diversity in terms of production structures responsiveness to exogenous stimuli behaviour of labour markets and growth
