potential theory in applied geophysics introduces the principles of gravitational magnetic electrostatic direct current electrical and electromagnetic fields with detailed solutions of laplace and electromagnetic wave equations by the method of separation of variables behaviour of the scalar and vector potential and the nature of the solutions of these boundary value problems are shown along with the use of complex variables and conformal transformation green s theorem green s functions and its use in integral equation finite element and finite difference methods for two dimensional potential problems are discussed in considerable detail the analytical continuation of the potential field and inverse theory used for the interpretation of potential field data are also demonstrated

how can we study one of the most elusive molecular properties chirality using nuclear interactions with the magnetic field that are apparently insensitive to handedness this book answers this question from the physicochemical point of view by providing a clear coherent and comprehensive review of methods used in nmr studies of chirality presented arguments based on fundamental physical and chemical laws and in depth descriptions of new methods utilizing purely physical interactions are mainly addressed to spectroscopists in both academia and industry the introductory chapters provide the reader with the basics of nmr spectroscopy as a tool for the study of chiral compounds and those more interested in the methods of chiral discrimination will benefit from the brief description of their common points and reasons why some of them may or may not work in the following chapters the book shows rapid progress in a newly emerging field of chirality sensitive nmr in particular a search for effects that give direct information about the absolute configuration of a molecule
